I seem to recall a CPX that allowed to switch between Serial 2 / LAN on the MegaSTe, i think it came with Sting but it worked under iConnect.

I experimented once with an Apple cable to connect to a Modem, i don't think i ever got it to work so there's not a plug and play solution I'm aware of!.

In theory you'd have to agree to the Licence in order to legaly install and
or use the software, this agrement would be extremely likely to specificaly
forbid reverse engineering, so either way it would be forbiden.

It seems that the QWERTYX box from Becroft is out of production and the maintainer of the Eiffel box is unresponsive. Is there an alternative out there? Does the Eiffel design work? Might another option be to extend the keyboard connecting cable (I guess it looks like some flavor of RJ jack?)? I'm shoving my 520 into a dektop PC case, and I'd like to use a PC keyboard.

TIA,
Matt

See this page, it looks like Eiffel is still supported.

Would anyone have the sound chart for a MidiSynth box? A friend lent his out a few years back and never got it back. We were thinking of doing a demo for our club but he doesn't remember all the various instrument settings that were on this chart.

Thanks...

Because it can work from 1 day to several years, you can't guess.
You just don't know when you'll have to open your Falcon again and
look for another replacement chip.

> then I agree using a new one is better (and make sure you really get a
> recent chip and not one that has been on the shelve somewhere for several
> years ...).

I've heard from several people that the battery was not supplying power
to the RTC until the chip was accessed for the first time, or programmed,
but I have never been able to spot this in any documentation or data
sheet so you are certainly right.

I think the most reliable fix is to change the battery by opening the chip.
It sounds tricky, but it is not so, because the chip is just a classic RTC
IC (a DS1285, in fact, for the DS1287) with a plastic box glued on top to
hold the quartz and battery.

>to convert u from Magic to MiNT, but simply to prove N.AES is very stable
>and powerfull AES.

Hohoho... hold the horses!!
I said it was lousy, it didn't say it was unstable. But thanks for the offer anyway. Nothing needs to be fixed here, what needs to be fixed or at least upgraded is N.AES, so may I suggest that you offer your help to the N.AES developers? It is still being developed I presume ?

>:))) Criticisng is okay, or even better, disliking... But when u do climb
>the barricades, u do that with pomp and bombs and heawy weapons.. U dont
>stop on bashing XXX apps, but attack whole comunity, coders and so on. U
>realy think i went berserk, sent u a mail, cause i had bad day in office?

Do you really think I'm gonna climb on the barricades with a peace sign and some flowers in my hair? If one climbs on the barricades it's not to sing a peace song.

>Also i never hear u calling CAB or XXX app, which u consider real one,
>programmers loosers and use names u use for MiNTers.

If something stinks or is crap I just say it... I don't recall when, but Google will... I've posted a message a couple of years ago where I not only had a go at CAB but also at the programmer, and compared to what I wrote in that particular post, the ones you are complaining about are kidstuff. IIRC I called him a member of the maffia and demanded my money back...

I also had a "small" argument with the developer of Wensuite here to the point that he announced that he would make sure that the next version wouldn't be translated in English anymore and explicitly forbid me to translate it, unfortunately there never was a next version of that pile of shit.... :-)

Oh, and then there's Draconis ofcourse <grin>,
Here's the clown that supported it from the very first version and kept on paying good money for bad coding. Considering that this piece of junk carried the "professional" tag and didn't even had a newsreader... not to mention it's so called javascript ability, I think I've been very friendly to the programmer in my posts. If I could rewrite those posts knowing what I know now he would need to be sitting on a very stable chair also....

If the developer of Papyrus ever dares to walk in here again he also has something coming. He promised us to fix some of the bugs that are present since version 5.0, he would also make sure that papyrus could load the 3 versions of GEM vector formats, etc... the list is too long, look it up in Google...

I hope these examples are enough to convince you that I don't just target MiNters... if you need more examples just yell, over the years I've spoken my peace a lot of times in here :-)

And let me tell you this Janez, I do make the distinction between free and commercial, when I have a go against someone who asks money for a piece of crap I *never* give in, after all, if one pays good money, the least he deserves is a good product. When something free is crap I'll say it as well but be less harch...

>Why u think ppl bother to make GEM frontend for cjpeg/djpeg, pop3 Gem
>front end, Tarit (tar packer front end) or MiNt Setter (Frederic). Or RPM
>front end. Those ppl could be happy with CLI versions, they know how to use
>them. I have feeling, but i can be wrong, those not interest you, since
>free apps and MiNTers did them....

Janez, interest hasn't got anything to do with it, the very first thing one should consider is :"what can i do with these ", well, except perhaps for cjpeg/djpeg nothing of the above mentioned utilities are usefull to me, the fact that they are free or/and written by MiNTers has got nothing to do with it. I'm not going to get rid of something I've been using for years on end and served me well. So Pop3 Gem and tarit are out, the MiNT setter and RPM are of no use since they're for a OS I do not use.
Before you have a go at me: you now what mailer I use... , I also use ASH Scripter and Jinnee, that combination is is sufficient to tackle any tar, rar, qzip or whatever you care to throw at me. I'm not saying that tarit is no good, just that I don't need it. I've got something which is every bit as good and more flexible, so no need for tarit... Where did you get the idea from that I have anything against free apps? there are quite a few here on my hard disk. I'm not going to spend money when there's a free alternative. But if a commercial one is better or like in most cases arrived quicker on this platform...

>Well all apps simply cant run on all 3 OS-es. Not cause "other" 2 are
>bad, but because they lack Unix envoirment.

Have any of you forgot where your origins are? Whatever the reasons are an application is OS-specific, you alienated MiNT from this platform and you want me to say thanks? Every time you come here babbling about it telling us we should give it a try, you are in fact saying alienate as well, sorry Janez. What you didn't say is how much memory that setup uses, can a normal expanded falcon 14Mb handle it? Handling means is there enough memory left to actually run stuff on it? What about the ST-series expanded to 16Mb and rubbing with their 68000? You come advocating in here to give a different OS at least a try, but forget to add that in order to do this roughly 80% of the people here will need to replace their hardware. Even if they were prepared to do so, where on earth are they going to find replacements? the production

of clones has been halted years ago, and the 150 CT-60's are long gone... so here you have it.
Be realistic for once, the MiNT setup you describe garbles up memory, RAM which most people don't even have. If someone has to spend quite a lot of money to upgrade he'll want his money worth, and do things with his new computer that people on other platforms can do also.. and then the software problem arises again. It's a viscious circle, and yes I know that you're tring tyo do something about it, but IMO it's too little too late.
If you still haven't fallen of that chair: I don't believe in the ACP project either. It's exactly two years ago this month that the fabulous xTOS machine would be for sale.... that generated quite some posts in here as well. Only me and Dr. Uwe Seimet said it was nonsense, and we've both been flamed for it like no one ever else in here. I don't like to bring this up again, but Lonny was also involved in that thread... If Uwe didn't shut up some here wouldn't upgrade HD Driver anymore, because they wouldn't want to pay for something coming from a person with such negative views... Uwe wasn't even allowed to say his peace and/air his views. :-*(
There is no hardware ready to buy at the moment which is capable of running the setup you propose comfortable. So come back advocating this system once that the ACP materialises. But then I'm sure we're going to have a discussion about value for money.... As it is at this very moment, for the majority of users, MagiC is the best choice, not because it's better but because it runs on a smaller amount of RAM and doesn't put a lot of strain on the processor either... the price for this is that no unix-like software can be run on it, people with limited hardware probably don't have a need for it either.

Cheers from Belgium
Dennis

From: Janez Valant <swe@atari.org>
Date: Sat, 19 Jul 2003 19:33:35 +0200

Hi Janez,

Before you start reading this post, you better make sure that you're sitting on a very stable chair. I'm really not doing this on purpose but I have a feeling that you might go berzerk after reading my humble opinions :-)

>>BTW: why on earth did you keep this ready to run app 2 years hidden from
>>this community you happen to love so much?
>
> Well i didnt hide anything. We keep repeating that SpareMiNT has all
>those
>packeges, ported already, so user can easily live and use software without
>ever runing GCC, but that never came thru... U keep repeating that u want
>to see all those app, we keep saying that they are on SpareMiNT, but noone
>bother to check if thats true...

How shall I put this without hurting your feelings too much ? I've had a suspicion when you told us that a new version of Ghostcript was available but not to cause any havoc, I've waited for the link to see if my suspicions were justified.... and they damned well are!!
Warp back a little in time: The previous version ran on any Atari computer with minimum 2Mb, it ran under SingleTOS, MagiC and MiNT. But this new version however all of a sudden in practice only runs on upgraded Falcons and clones, and to top it of it can only run under one OS... and this is exactly what I've been going on about... what it boils down to is that now only a small minority can use it. What on earth has been so drastically changed in the source that it's a MiNT only application now? The previous version it's GEM front wasn't much to shout about but at least it has one, and the application could be used by almost any Atari user. So here we are, some odd years later, we moved on.... the app only runs under one OS and a very small number of computers. Like I said before, this is not moving on, it's rather like going backwards.

>Fact was, those apps were a dream and MiNTers conspiracy.

From where I'm sitting it sure is... I'm sorry Janez but I can't possibly call this a Atari application, it can only run on one single Atari model on condition it has been upgraded, and furthermore it only works on one of the three major OS's. If the Falcon isn't upgraded then it just doesn't run on any real Atari's at all, and you know just as well as I do how many active clone users there are...

>I realy advise u or ppl interested in MiNT to check SparMiNT pages. There
>are TONS of ported software, all in .rpm form to allow easy
>installing/deinstalling/upgrade. In a way, installing rpm is easier as
>installing GEM application, no paths etc are asked, since Unixes folow
>exact folder structure. (user may use own paths, but public packages for
>XXX distro, are standardized). And afaik, there also is GEM interface for
>rpm application.

Remember the (unfinished) Joe Atari average story? Well, if Joe A. surfs to those pages, he'll need to be sitting on a very stable chair as well. I put it to you that someone interested in MiNT, will be scared to death after having just a tiny little glance and run back safely to his SingleTOS or MagiC setup....

Cheers from Belgium
Dennis

>http://perso.wanadoo.fr/dsavel/ds1287e.htm

Yup - I did that quite some time ago to a MK48T02 (as used in SUN Sparc machines):

http://heisenberg.ccac.rwth-aachen.de/~michaels/images/nvram1.jpg
http://heisenberg.ccac.rwth-aachen.de/~michaels/images/nvram2.jpg
http://heisenberg.ccac.rwth-aachen.de/~michaels/images/nvram3.jpg

These are a bit easier than the DS1287 because they consist of a "nearly normal" DIL chip with a backpack that contains crystal and battery, and that is only connected on the two short sides - you can see where I removed half of the backback (with the empty battery) and connected a new battery (and no, the MK48T02 will not work in a falcon).

This method may not look very "professional", but it works well (especially on a weekend where a replacement chip is difficult to obtain).

Yes, I am developing it further. I have to make a prototype of a new
PCB design, that will support Atari joysticks. I also have the source
code now to the PIC as I tried to contact Laurent many times (even
sent a snail mail letter) but no response :(

Thanks, Lyndon

Hi Matt,

>It seems that the QWERTYX box from Becroft is out of production and the
>maintainer of the Eiffel box is unresponsive. Is there an alternative out
>there?

Yep, Peter Denk computers in Germany has manufactered a similar interface,
you can connect any PS/2 mouse and keyboard to it, no drivers are needed, a
micro-controller emulates the Atari keyboard layout for 100%. It also works
with the new batch of wireless devices.

http://www.ATARI-Fachmarkt.de , IIRC the device is priced at 29 EUR, that's
$30 or 20UKP

Cheers from belgium

Hi!

There has been a discussion about the lack of file locking on MagiC here. I confess I'm not a programmer, bu doesn't the AUTO-folder program CHK_OFLS which comes with Kobold perform this function? It seems to...

On the question of porting GPL apps to MiNT: To my mind, and I suspect the vast majority of Atari users, if these apps run so slowly on 90%+ of existing machines, they are of little interest. To tell peopple that they need to buy expensive upgrades or new machines to use them is just stupid! They would be better off buying a cheap PC and use that - with or without an Atari emulator.

Just my 2 cents worth!

Regards, /Peter/

Hi Frederic,

>Dennis, please stick to the thread. OS issues, not hardware, I know you
>know the difference.
>
>Unrelated. Please drop this hardware issue.

IMO they are related. In fact these issues go hand in hand. Someone with a for example 4Mb MegaST(e) doesn't even have to read this thread. Neither MagiC nor MiNT can be installed "properly" on such a computer. When you want to discuss OS issues then the hardware suitable to run these come automatically in play also. On a expanded Falcon with 14Mb one won't run very far either....

>In what way does using magic as opposed to other OS helps your TT playing
>mp3 files?

Oh.... it doesn't. The TT isn't powerfull enough to play them. I need to convert the mp3 files to WAV or AIF first. So the discussion of mp3players goes over the head of all the TT users really, they can't play them, so these players are useless to them. It doesn't make one cent difference if the discussed player is open source or shareware, they both can't perform miracles on a 68030 without DSP. So if I say ported open source software like this is of no use to me.... there's no need to go berzerk, try to see it from where I'm sitting. In practice only people with Falcons and clones can use these players.
And to make this post a little OS specific: supposing that a TT would be able to play mp3's, then using MagiC as OS would put a little less strain on the processor vs MiNT...

Cheers from Belgium
Dennis

Sorry guys, coffe mug mishap, so i acidentaly sent the message.. So proper message here:

> Dennis Vermeire wrote:

>
>> I hope these examples are enough to convince you that I don't just target
>> MiNters... if you need more examples just yell, over the years I've
>> spoken my peace a lot of times in here :-)
>
Yes they are. Im now totaly convinced that any reasoning with you is futile. Period. U are the grand jury and the judge. I am also 100% convinced u do hate MiNT and all related to it, UNLESS they are total quiet or even say bad things bout MiNT. Any try to explain comunity about some advantages, no matter if some people want or neeed it wil result in bashuing and patronising from you. In long posts i sent, u carefully only reply on parts u can use to bash.. and in most cases those are "i dont need that os its useless to me" Yes it may be useless to you, but what about the REST of us?

I (we) never pushed ppl toward MiNT. U on other hand, try to show MiNT as OS which alienate from Atari. U dont care bout fact MiNT is ATARI, and Unix part is hacked, not Atari part, u dont care the fact that MiNT GCC produce totaly valid TOS or TTP executables (there u may hate or dont wana use them as u want, they ARE proper Atari platofrm applications). U dont care we repetitvely say that Unix apps are ADDITON to existing and fully functional Atari envoirment, whuch is priority in MiNT... In all mails u just try to implement miNt as alien OS to ppl's mind. U dont acnowledge my many times said acknowledges to Magic. Also u keep bashing MiNT bout alien apps, u didnt ONCE tell us proper GEM replacement. maybe even GEM replacement in development. In one message u said (probably careless) that there is little in line, as new apps are concerning. Yet with abvious lack of new apps, u hate and dismis any app whuch aint pure Atari app. In same spirit u also "overlook" our opinion that we dont prefer alien apps over GEM ones, but sadly thats all we have.

>> Janez, interest hasn't got anything to do with it, the very first thing
>> one should consider is :"what can i do with these ", well, except perhaps
>> for cjpeg/djpeg nothing of the above mentioned utilities are usefull to
>> me, the fact that they are free or/and written by MiNTers has got nothing
>> to do with it. I'm not going to get rid of something I've been using for
>> years on end and served me well. So Pop3 Gem and tarit are out, the MiNT
>> setter and RPM are of no use since they're for a OS I do not use.

Thank you for this. Yes i also do think on many apps "What can i do with these" and in many cases i realy dont use them. However, i never BASH

authors and their intention, and i still respect their work. And major problem with u is that as soon u found on app u do not like, no matter that author need to put sweat into it, u will bash author, OS and anyone who may actualy like it. Who the fuck cares if u dont need/like TARit and MiNT setter? They were created for ppl, who have wish to try MiNT, to make their live easier.. Still not a gram of good thought to those coders from you. I dont need any MIDI app for example, but im still proud we have/had apps like CAF, Notator, etc... FACT is, existance of tar archiver (of which usage is as it seems a mistery to you), MiNT setter or RPM does not harm anyone. It actualy bring Tar, installing RPMs onto GEM level, same as app u happen to like does (Anodyne stuff). Those also arent only apps, i just name few. And on end, as much u hate Lonny or Frederic, they do stand behind those apps and i also know few happy Airc users on Magic.. They did those apps, they added to comunity, u did what? U hate them, deny all their work and maybe ull use your enermous knowledge and translate airc RSC files. That will realy bust Atari scene enormously.. Maybe we need to stop coding algorythms, just provide u with RSC files?

>> Before you have a go at me: you now what mailer I use... , I also use ASH

>> few here on my hard disk. I'm not going to spend money when there's a
>> free alternative. But if a commercial one is better or like in most cases
>> arrived quicker on this platform...

As soon app is free and smell on MiNT u go berserk. I wont enter discussion here, but anyone who smeled CLI from distance, know that CLI scritpting,combined with pipelinig can do a lot more as Scripter and Jinnee. And not because i now want to deny Scripter (which i already admited id like to see with N.AES), but because Unix CLI and its apps philosophy is based on scripts and pipelines etc, and also dveloped for ages....

>>>Well all apps simply cant run on all 3 OS-es. Not cause "other" 2 are

>> there enough memory left to actually run stuff on it? What about the
>> ST-series expanded to 16Mb and rubbing with their 68000? You come
>> advocating in here to give a different OS at least a try, but forget to
>> add that in order to do this roughly 80% of the people here will need to
>> replace their hardware.

Look. Using an alien application on native Atari OS cant be called forgetting origins. Creating TAR or RPM pr whatewer shell also. U realyu dont care we always repeat MiNT is native, its way diferent as Linux in that respect and so on and on. That doesnt matter. Word used in messages was MiNT and u get resd mist on eyes... thats ALL.

BUT how low can u go Dennis? How hipocritic can u be? In many messages i DIDsay that MiNT is very RAM and HDD hungry. I also said that i am realist andthat i do recomend Magic to all who asked me, if they havent TT with FASTram, or Falcon with 14, preferably more.. Except if they have big with to try Unix.. and to all i also say (well most ppl know that) that there is Xboot etc, so they can boot in OS by their desiree. Realy, u deny and overlook all i ever said in favour of Magic or any MiNT specific thing i mention (like RM usage HDD space etc..) Also u overlooked, that there is MultiTOS like setuo (1.15.4 kernel, N.AES and Thing boots with 2.5mb free ram here, less as magic, but not unusable). If u boot with kernel ONLY, and only use some MiNT goodies with single tos AES, u dont even notice MiNT...

Im firmly convinced that u do overlook these points (not some small hiden ones, in some odd topic) on purpose, and purpose is to deny all what we stand for and enforce your supremacy over me and others....

>> Even if they were prepared to do so, where on
>> earth are they going to find replacements? the production of clones has

>> and we've both been flamed for it like no one ever else in here. I don't
>> like to bring this up again, but Lonny was also involved in that
>> thread...

What do u know bout ACP after all? I dont now claim it will 100% happen, but i saw evaluation board from Motorola ACP at EIL, saw many ppl working hard on it, sav SuperVidel guys.. They DO work on it.

I also remeber u and Uwe here said that CT60 wont ever happen. Same was said for Highwire. HW is not finished, yet, ppl are working hard, and u again took liberty to comment that in your own style. U and Uwe tend to declare all nonsense... Well in some u were right, in others u wasnt.. CT60 already sit in my machine.

>> If Uwe didn't shut up some here wouldn't upgrade HD Driver
>> anymore, because they wouldn't want to pay for something coming from a
>> person with such negative views... Uwe wasn't even allowed to say his
>> peace and/air his views. :-*(There is no hardware ready to buy at the

>> moment which is capable of running the setup you propose comfortable. So
>> come back advocating this system once that the ACP materialises. But then
>> I'm sure we're going to have a discussion about value for money....

Value for money? What value? Face it, developers are gone, not because of MiNT, but because hardware was stucked, there was no proper internet (and mint declared and named all sorts of view) so they migrated.. MANY of them on Linux, so Unix. Iwe hear many remarks that they would like to know bout MiNT etc in 95 etc.. There is lack of new hardware (ACP guys work hard, but HW development is hard and exp tho), lack of new software (developers migrated to platforms with bigger userbase etc) and yet, u took any oportunity to bash developers still remained, since they have will to work and maybe a bit diferent ideas as u. I want still to use my Atari in many years. Not like u, who uses xx for years and u dont need more.. and stagnate. I will use my Ataris in further years, ill get exited by any new HW announced, i wont dismiss any like u do, ill be disapointed many times, for sure, but thats life.. U dont want life, u want vegetation. If prize for using Ataris or machines yet to come is some alien app or driver, its price i must pay... U will sit, each year with less developers, and curse and laughter on anyone who will try to make a difference.. Not only that u dont create (except occsianly mess with RSCs etc) but u also have balls to laugh, and slack anyone who try to make any diference, no matter if he is on end very or little or not succsfull. U will take any oportunity to deny him at start already.

>> As itis at this very moment, for the majority of users, MagiC is the
>>best choice, not because it's better but because it runs on a smaller
>>amount of RAM and doesn't put a lot of strain on the processor either...
>>the price for this is that no unix-like software can be run on it, people
>> with limited hardware probably don't have a need for it either.

Man, u are master of hipocracy... Did i ever said Magic is not solution for all with so called "lowspecs" machines? I did many times, and for same reasons as u now name. I did that because its not my intention to push MiNT on anyone computer. All what i (we) want is recognition that MiNT is capable, that is future on more powerfull machines, and on machines yet to come, if they will come of course. And that there are users with TTs with TT ramcards, ct2 and AB040 machines, CT60 machines ... Any rasoning from me about ACP was folowed with "providingly ACP becomes reality". ACP or AtariONE etc name is not important, important is that MiNT with GCC can offer instant lib of new apps, esp protocols etc so machine can live, sine can be used... Later developers sure will implement those new things into GEM apps, same like Didier does etc... If u wish to declare any attempt as useless, stupid or nonsense from start its ok, dont poison all others with that.

Well its last message from me... Ill crawl back into pit i came, ill do my ill designed applications of no use to anyone there and ill continue to kill Atari with them... Ofcourse, if some heretic escape big brother here, ill be glad to help, and give support...

Janez

P.S> if i accidentaly hurt anyone else here, i apologise, it wasnt intentional. Help about MiNT, installing it etc still stands, ill be glad to help with it. Same goes if someone need a shell etc for cli application without u cant live etc :) Ill try to help even if u will run it in Magic, and dont worry i wont sabotage it!

No no. Noone suggested to buy expensive upgrades. GPL apps indeed are slowish. The most GUI ones that is. CLI ones are okay, also Knews is quite usable on my Falcon. Point is, that since development of native Atari apps is close to zero, esp for copyrighted applications. So on CT60 (there are still fans who wanna use Ataris or clones) or ACP, of it will happen, those can easily be used since all u do is to compile them. That especialy consider future interner protocols, new gfx/music formats converters etc. I dont expect anyone will compile Kword etc, if we can happily use Papyrus etc... Main emphasis is on some protocols etc which future can bring... Those apps and drivers etc dont use much CPU etc, and are usable even on plain machines... like we now use nfs, imap, etc drivers..

Janez

Obviously you have never tried this stuff.
No they are not so slow that they are unusable, I have used them on a standard speed Falcon and TT. If you are refering to the text based ones that is, quite usable, as for X11 yeah, you might find that slow.

Glad you mentioned that, because what was going on was Atari users beating down other Atari users, and anyone I asked directly told me flat out that Uwe was wrong. It is one thing to air opinions, but how you air them is also important, he only needed to say once, something along the lines "that he's is not interested in ACP at all", we all can accept that. Not everyone wants to spend more money or follow such a dream. But no, he had to hit almost every post that mentioned it with a negative comment, effectively becoming what appeared as anit-Atari. That is also not a good position for a software developer, sort of goes without saying. I think Uwe is a good person at heart, he just got too wrapped up in that format of posting, it is a trend here if you had not noticed.

Uwe did make his comments known, by the mere fact that you know his views, you just proved that his msg got through. Repeating it um-teen times isn't productive, people can go to the ACP site and judge for themselves.
You only bring this up in an attempt to make me look bad, you can't get me to shut up so it's back to trying other angles again. You are wasting your time.

You don't see it, but you are acting the same way, you can't let a post go that mentions MiNT in a positive way, you keep beating it into the ground to the point where you come off as a narrow minded, self centered ego maniac who don't give a crap about other peoples needs or feelings. Then when you can't win an argument, which isn't really an argument per say, it's just you to stubborn to admit that MiNT has great value to others, you then start making fun of clones and such. You are now looking anti-Atari as well, it is in fact Atari users you are attacking. It is Atari software for Atari's you so easily write off as having no value whatsoever. You guys accuse me of stealing, pick on my Hades and god knows what else as I don't see all of Steve's posts. I never sank to that level, that's just sad really. Others see this and know what I'm saying is true, they just won't post, because if they do you add them to your sh*t list, then find some angle and attack.

Your thought process is quite frankly bizarre, apparently if it's not
an actual GEM app it is just crap straight out. So you must think demo
coders and game coders spend all day wasting their time too. You
specifically like ports that run directly on magic but not others, that's
also hypocritical like you accused me of being. MiNT's background stems
from Atari itself, the separate AES, the separate kernal, it has more
roots in the real Atari than magic ever will in my opinion. You have
clearly picked a side and won't even accept the other one at all.
It don't bother me one bit to say magic has great value to many people.
I am glad they found some way to stay with this platform.
I certainly hope that they are more open minded than you.

I fully advocate filters, if you don't want to read anything about
MiNT, unix, linux, or ACP, then use a mailer with filters or skip
the posts. Or filter out me and swe or anyone you don't like.
You are mistaken if you think you can drive them away, by the sheer number
of apps on the SpareMiNT site, it's not a passing fad, it's the future. So
either get over it, or ignore it. I'd like to also add, if you don't fully
know what you are adding your "2 cents" too, research the topic then post.
Otherwise, staying silent is the best course of action.

From the Kobold manual:
---QUOTE---
The optional CHK_OFLS (check open files)... is used by Kobold to
prevent any open files from being lost or destroyed.*) If for
instance you are running a database program, e.g. Adimens of
Phoenix (or another program where files will be left open until
the program is terminated) and want to call Kobold, you will be
warned and given a chance to swich to GEMDOS mode.
*) If you use MultiTOS or MiNT (V0.94 or higher) then you will not
need CHK_OFLS.PRG.
---UNQUOTE---

It seems to prevent access by other apps as well...

>No they are not so slow that they are unusable, I have used them on
>a standard speed Falcon and TT. If you are refering to the text based
>ones that is, quite usable, as for X11 yeah, you might find that slow.

I see, thanks. From the postings in this series it sounded like a
CT60 - and there are only 150 of those :-(or the new putative ACP
machine was a minimum requirement for usable GPL apps.

From my point of view these would have to offer some considerable
advantages if I had to forego a decent GUI to use them. (Of cpurse
this does not apply to demos or games, but you hardly 'use' them in
the same way! :-)

I am not anti-MiNT, but for my personal requirements MagiC+NVDI seems
extremely stable on my Nemesised 14 MB Falcon and does most of what I
want (apart from high-colour graphic-heavy apps such as browsers - and
the restriction there is the processor speed, not the OS). Nor do I
need multi-user access that would require file locking etc, and I
think that goes for the vast majority of Atariites. Those that connect
these machines to routers or other computers must be a tiny minority,
but I agree that for them the MiNT environment seems to offer
advantages. But I'd be surprised if that was more than 1% of Atari
users!

But live and let live is my motto - if MiNT suits you, use it :-)

Regards, /Peter/

Which is exactly why if anyone really cared, could assist porting EmuTOS on
the Q60 (68060@66MHz full MMU and FPU) w/128Megs RAM and High-colo(u)r.
That platform would give you anything you wanted and you could install
anything you wanted (ie MiNT etc) on it... and play your MP3s to your
heart's desire :-)

That's cool, that's a very positive thing and a way to safe guard against accidental data loss.

> I see, thanks. From the postings in this series it sounded like a
> CT60 - and there are only 150 of those :-(or the new putative ACP

Certain members here would like to convince the masses that all this stuff is unusable on stock machines, some of it is very usable, some is not, and depends purely on ones goals and setup.

> From my point of view these would have to offer some considerable
> advantages if I had to forego a decent GUI to use them. (Of cpurse
> this does not apply to demos or games, but you hardly 'use' them in
> the same way! :-)

That is another mis-conception that is perpetuated here, there is a GEM gui, and looks are very subjective, and so is speed. Everyone has different breaking points where they might decide something is too slow. But with the right setup the unix stuff runs in a GEM window on the desktop.

You don't lose GEM at all, instead you gain unix access. That might
be hard to image unless you see it . One really should have a need for this
stuff, otherwise yes it can be involved to setup and use. At least it is an
option. It is best to stick to what works for you for sure.

That is a nice setup, I've never seen a Falcon with a speeder of any sort.
Someday I'd like to see something like that up close. I also hope
the ct60 gets all sorted out, was benefit even if we don't end up with one.
;-)

Big correction that shows you don't know what you're talking about.
I did full mint/kgmd (aes included) install on megaste (tos 2.05), it
worked perfectly fine. The problem is that once you have everything
running, you can't run more than 1 GEM application at a time (unless it is
a small one). So it defeats the purpose of multitasking OS.
But from a full install (like I had) to something usable, you can trim
stuff out, a lot actually, as it is very modular. For a newbie with low
specs machine there are some type of install you can do to be manageable.

Now, to really prove you wrong, you say:
> On a expanded Falcon with 14Mb one won't run
> very far either....

I say: I'll take "Total bullshit for $800, Alex".

You don't make no sense.
As stupid as a gamer complaining to ID because Doom 3 won't run on his pentium 133Mhz and S3 video card.
Well, guess what, software come with pre-reqs, Can't work miracle.
2) if he was a so called gamer, he would have something a little more 21st century.
3) very nice to "insult" Didier's effort as it makes his work totally useless to the community as only the "privileged" ones (mind you, the people who spent a little money on their hardware, to exactly achieve things they couldn't) will be able to enjoy.

I still don't understand why my Pinto can't do 0-60 in 4.3 sec.
I will talk to ford and complain, maybe even sue them. I should definitely be able to do this.

> And to make this post a little OS specific: supposing that a TT would be
> able to play mp3's, then using MagiC as OS would put a little less strain
> on the processor vs MiNT...

How the hell do you know?????
Have you ever benchmarked it, ran some test? some stressloading?
News to you, I have used both heavily, and can already tell you that actually Aniplay feelt smoother, the whole computer was smoother.
Once again, if you don't know, just shut it.
Freaking unbelievable.

Am I hallucinating????

Is Dennis for real??

Dennis, are you still arguing on the file locking????

You know what, after all, you're right. And a new change of carreer, you
should definitely become a Microsoft OS architect, or for Apple, or
whomever. You have a lot to teach them.
You have it all figured it out.

In m country (Poland) and in most other countries it is perfectly legal to
Reverse Engineere a program if you will not use a knowledge from it to
davelop a program that does basically the same thing, and you want your
program to gain compatibility with program you RE and such information is
not avialible in other way.

> that is easy use and setup than I might be interested.

MiNT has no looks, it's a kernel, not a GUI. This is exactly my problem with Magic and Windows, the looks being intertwained with the OS functionality. The two (should) have nothing to do with each other.

You can choose which GUI you want to use with MiNT. If you go for N.AES, you can completely configure the looks to your own needs since it has a theme handler (like Magic has). The fact that you don't seem to know, proves my point that all anti-MiNTers seem to base their opinions on the crappy KGMD distribution with the ancient and unfinished Atari AES 4.1 and MiNT 1.12. Which is why it's impossible to have a normal, serious and in-depth discussion about Magic functionality vs MiNT functionality. Which is why it always ends up in flamewars.

> version of Magic was you using??? Give up some web-
> sites with information and pics that show that MINT is
> superior and is constantly improving there OS and I
> might become a believer.

MiNTers keep telling Magicers to look at the latest MiNT versions, N.AES, XaAES and distributions like EasyMiNT and SpareMiNT. But you people never do, you just ignore it and keep complaining.

My two cents in return :)

Maurits.

> MagiC setup....

If Joe is one of those people who gets scared off by a site with too
many letters and not enough piccies, he shouldn't be using a computer in
the first place (or at least ask a more educated family member to
configure it for him). RPM really is really easier than any other
installer I ever saw in Tos, Magic, Windoze or any other system.

Don't complain until you tried. Don't just look at the site and feel
scared by the fact that you have to read something.

If what scared you (or Joe) is the stuff you have to do to get RPM going
in the first place (bootstrapping), look at EasyMiNT first. It installs
MiNT with RPM without any real effort from your side. But you already
knew this, because as you told me, you already know the latest
installers. Right? :)

Maurits.

I'd like to thank whoever it was (Ian H. if I correctly recall?) who thought
my message about the UVK support site was spam and who complained to my
provider. I got an official warning and all that, which is great obviously.
Next time, what with me not exactly being a spammer (habitually or not)
please take it up with me first before crying wolf.
I was advised not to take things personally, but this official complaint
lark makes it a little difficult. By the way, the person involved neglected
to explain to me why he thought it was spam exactly, so I can only assume
that he hadn't got laid the night before and on second sight he didn't
consider it spam either.
Well hey. I guess he is, in gamers' terms, a n00b to comp.sys.atari.st.

Well, there is something I am wondering about : AFAIK, the Eiffel adapter is designed to operate behind one of the historical UARTs of the ST, that is through a serial link. But hadn't you claimed that UARTs would be DEFINITELY dropped in case that you go for a project of like a G4 based clone with an all-USB approach ?

Fred

4862. Re: Ultimate Virus Killer 2000 - Atari ST/TT/Falcon virus killer (and the message being spam - or not?)

Well, the rules of society apply here as well. There are idiots here in the newgroups as there are in our everyday lives, work, school etc. Personally I get really sick of the constant bickering that's going on here. There was no reason to consider your posting to be spam.

Joshua.

4863. Falcon 030 for sale - UK/Europe ONLY!

Newsgroup: comp.sys.atari.st
Date: 2003-07-21 15:00:17 UTC
From: Derryck Croker <derryck@nospam.cix.co.uk.invalid>
Message-ID: <BB41BE8E.3EAE%derryck@nospam.cix.co.uk.invalid>
Source record: 25345

I have a Falcon for sale so thought I would offer it in here, to UK or
European destinations only, before it goes to eBay.

* Nice clean condition
* 14MB System Solutions RAM card
* Accelerator of unknown origin/specs
* Case screws missing
* No IDE drive
* IDE ribbon cable and drive bracket supplied
* No software, mouse etc included, bare computer only
* NVRAM battery is flat, use a time-setting utility or replace NVRAM chip

I'm looking for 250 UKP or up.

That's simple !
I have a list of buyers who paid....the order list is the date when I received money.
So, I follow this list...
The exception on this is developers who received all the CT60 in the first shipping period whatever the date I received money.
A small proviledge for people developing and helping for debuging.
A second exception was swedish people, because of the near date of their atari nordic show...

I think it's easy to modify eiffel and replace classic serial link by
and I2C link like the the EEPROM on the SDRAM because today this method
is used on the CT60.

> the same way! :-)

Well the most decent GUI we can think of is GEM :) I used graphical news reader Knews in GEM, since XGem run Unix GUI apps on N.AESs window, and i set QED as external viewer/editor in Knews.. On Ct2 it was usable, but i think thats minimal configuration.. Or because Knews would be to slow, ot cause also MiNT feels tight on 14mb, esp if u wana run XGem.. Prolly 14Mb wouldnt be enough... Just want to say, i used Knews only because we dont have good news reader....

> I am not anti-MiNT, but for my personal requirements MagiC+NVDI seems

> users!

Id say there are a lot more as 1%, but not majority by far, hard to really estimate, 1% or 5 or 20%... Fact that u use Magic dont make u ant-MiNT. If lagic suits you, since it left u more free ram as MiNT, make less stress on CPU, why the hell not :)

> But live and let live is my motto - if MiNT suits you, use it :-)

EXACTLY!

Regards, Janez

P.S: would u care a small betatest in few weeks? Magic and Nemesis is what i didnt test yet...

For more info on file locking see:

http://yescrew.real-atarian.net/eng/howtocrash.html

If you attempt to test this, please be aware you risk damage to your
HD as was stated in a earlier post. Those that use magic should be
aware of this missing feature.

>
> Maurits.

Yeah,

As a hard core anti-mint'er all I have to say is that on a machine with
proper specs (030 + 16+ Megs of RAM), I wouldn't use anything but MiNT.
NOTHING. It's GREAT!

Anyway, seriously I was never anti-mint. I gave it a shot back in the day
and it was buggy and crashy as hell. I got some real hardware to throw at
it and YES. MiNT feels and probably IS slower than MagiC even on the
faster machines but IMHO it's becoming much more worth it for me. The
network support is important as my atari's have ethernet now, etc. The

problem is that most of the anti-minters are trying to use their atari's like they would 10 years ago. I live in the present, and so do my atari's. I have a TT right beside me that is involved in my daily duties as a sysadmin.

And MiNT is the only REAL option for future Atari machines. The power of the open source world means our systems will still have present day applications. Don't ignore that, it's a huge benefit of open source.

Hi,

What are you gonna use it with, an ST or an emulator?

The reason that I ask is that I looked for this game about a year ago, and there are loads of menus with different versions on, None that I found worked properly with an emulator. some just wouldnt start and some locked up while playing :-| (i used Steem and pacifist)

I ended up buying an original copy off ebay and dusting off the 1040.

Smeg.

BTW Thanks for reminding me of this cool game, cos ive just got tired of playing Wizball (lasting 3+ hours per game) and I was trying to think of another cool game to play..... (I use my stacy with a colour monitor for games now :-)

No! You should insist on your ISP to take back the warning! Write them a
letter (not email but pen and paper) and tell them you don't accept the
warning. Your ISP should then addres there complaints to the person's ISP
who made the initial false spam statement.

This may be of importance in the future if you get other complaints of
any kind...

>>Well, the rules of society apply here as well. There are idiots here in the
>>newgroups as there are in our everyday lives, work, school etc. Personally I

With the difference that those who apperar here must be really tragical
personalities: A small kid in a grownup's body that for once can "take a
fight" without the risk of facing "the enemy". Actually quite similair to
those who beat women (wifes etc) when they get home. All because they got
frustrated at work etc.

To avoid being part of this behaviour _never_ followup to idiotic posts
with anything but logical reasoning, and filter out the worst abusers.

Just struck me there may be a reason why so many of the abowe mention
characters appear here: Interest in computer games.

In many games you get the opportunity to experience aggresions/dangers
without the risk of facing the consequenses of real life, a coward's
paradise...

Actually I still have an old ST lying around in the cupboard. It works fine
and I got some cool joysticks off ebay which I'll have to modify a little
because they were originally made for some nintendo console.

Problem is I don't use an emulator and the version I have is an .st file
which I can't for the sake of me convert into a decent ST disk. Just won't
work! D*** ;-)

Regards,

Ole.

Yes, really to expensive for just the UC.
The one i buy last week for 150? had
* CENTRam14MB
* CENTurbo1B
* No screw
* No IDE Ribbon and drive bracket
* A Bunch of software (NVDI4, HDDriver, MagiC5, NEON, ...)

So .... 352? is a lot of money for this.
```

That because they love using it that way, including myself.
I really dislike the idea to have an Unix on my Falcon or my TT.
Kuz it'll become just an Unix machine, loosing at same time the
Atari spirit.
If i really want an Unix i'll afford a new PC architecture.
Just for example, ALL MY PC have Linux or NetBSD, and I have 4.

I hope you can defend your case with your provider? It wouldn't be good
if any idiot could make every ISPs send wardnings to whoever he doesn't
like.

Mine only cost me ï¿½100, has all but the accelerator in it, plus it has all
the screws, NVRAM working, AND a shed load of software on the HDD.

Tim

Hmm. I just made an Automation menu 390 disk, which has Paradroid and ATF II
on it, and both games work fine on my Stacy. Disk needs to be formatted to
800k (2s 10s 80tr) or you can just let makedisk format it itself while
writing it (slow).

Smeg.

Mine cost $305USD and came with external cdrom, zip drive, 28.8 modem,
72pin 14 meg upgrade, internal 2.5 1xx meg hdd (which soon went bad),
vga adapter, and a HUGE LOAD of REALLY GOOD software ;-) (Including boxed
copies of Substation and other cool games, as well as recent versions of
Magx, NVDI, HD-Driver, Kobold, CAB and a ton of other expensive ones.

Why? Didnt we said kazzilion times, that AES is main GUI in MiNT? U dont loose any spirit, i use ACE, Apex Media, Thing desktop, CAB etc daily. With all feeling and usability we all like.. Unix part is just added. At same time as AES (N.AES and Thing etc..). I can use Unix CLI on virtual consoles, and Unix GUI apps in GEM window, sine XGem is Xserver for GEM.. And GEM apps can use Unix resources, like NFS, or Unix sockets, so CAB support SSL etc.. No spirit is lost.

How long ago. The last falcon I can find on E-Bay

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=2740470577&category=124
7

fetched rather more than that, and it seems to have less good stuff. Of
course I know e-bay can be overpriced,

See Dennis, the brainwashing you've done definitely work.

Now, NSPIRIT, in what way will it lose the Atari spirit?
I bet you have never used it, nor seen it in your life, but already the
assumption that it will be any less of an atari with atari software.

Great. Misinformation, exactly why Dennis is not my best friend.

Perhaps :) But for me thats using native GEM apps, TOS ones as well,
using each and any application people also use in Magic. Also using all
those apps with protocols as AV server, dhst server, drag'n'drop... Except
for close fans, using N.AES is equal to using Magic. If u only install MiNT
kernel and N.AES, without Unix envoirment, thats just another mtasking OS,
native of course.. So what do i miss here, what Atari spirit may be
diffrent from that? :)

I got a Falcon one year back for 44 euros, it was plain Falcon, with 14mb ram, 120Mb IDE, monitor adapter, joystick and 100 floppies. 2 y ago i got Falcon with SRC card in tower case with 120Mb IDE and 105mb Syquest drive, 14mb RAM, FPU, PC keyboard some accesories, VGA adapter etc for aprox 250E. My main machine is Falcon i bought 3y ago, plain, with 14MB ram, 65Mb IDE and it costed approx 200E. And last Falcon i have is MKX, 14MB RAM, 1Gb SCSI, FPU.... costed 220E... So 600USD for machine on Ebay is realy to much. esp since i bought its SUPER upgrade ethernec, directly from author for 25 ukp.

Guys in #atariscne also have many machnines and prices usualy are from 100-200 euros for plain machines (14MB)... Attached SCSI CDroms, usualy 4x or 12x etc dont worth much anyway. Imho reason to pay more as 200E is some gfx card, accelerator etc...

I bought mine on ebay. gotta watch. I got a good deal because I stalked
ebay falcons for a long time.

Mark
http://atari-source.com

Also remember I am in the USA. I'd think UK would be better since they
can get shipped in from places where they might be everywhere and cheap
like Germany or Sweden or something.

Hi Frederic,

>Am I hallucinating????

I've no idea.... have you eaten any mushrooms or cake lately?

>Is Dennis for real??

Oh yes... no worries, I'm not a fragment of your hallucinations.

>Dennis, are you still arguing on the file locking????

No, not anymore.
I think I've found another topic to drive you all mad.

>You know what, after all, you're right. And a new change of carreer, you
>should definitely become a Microsoft OS architect, or for Apple, or
>whomever. You have a lot to teach them.

Thanks Frederic..., I really appreciate this :-)

After long considerations I've decided that the Unix community would be best served with all my knowledge and indefinite deep wisdom, and since they are somewhat the underdog as well... the only condition is that they give me carte blanche ofcourse. Before you'll know it the next release will blow the competition away. Since the concept isn't much to my likings I'm toying with the idea of reverse engineering MagiC and slap the Unix label on it. I do expect a little opposition from a couple of unix users... but hey, I'm used to that, CSAST has done wonders in that department. I'll just tell them that we're moving on and if they don't like it to stick with what they've got or migrate to a different platform.
I won't forget where I came from ofcourse, so I'll inform these discontent unix users about our little platform and MiNT. It shouldn't take long before some ten million users migrate to Atari, reviving this little platform back to its former glory :-)
Once that I've finished "tuning" unix, I might just peep in at Microsoft, it seems to me that Bill his little OS could do with a little "tuning" as well, and once that's done all the discontent Window users will migrate to our platform also, can we take 500 million users?
I'll leave Apple alone, they like to be different, they've succcesfully build their firm on that slogan...

Imagine.... all this happening just because MagiC can't lock files :-)

Got to stop now, and treat the unix users to some magic.... they don't know
what they've been missing out on :-)

Cheers from Belgium
Dennis

>researched google newsgroup and found the thread but couldn't find such
>statement.
>Is google broken? Or can't I search effectively?
>Dennis, could you give me the google URL archive to the "retarded morons".

Not really.... unless you help me a little ;-)
I store all the posts in Emailers database mode, If you could let me know
what thread it was, then I'll find it back in a jiffy. We've had so many
arguments in so many different threads.... I find it much easier to store
the posts in Emailer, then have to go searching for them on Google.
Maybe I had just a bit bad luck, but on several occasions I found out that
Google isn't all that complete, several posts from me are missing there as
well.
Can you imagine it? Here I am trying to make this world a better place for
all Atari users and in 100 years from now, no one will remember :-)

>Also, Dennis, make sure the name is spelled correctly, no T at the end

Sorry,
I happen to know someone who's called Fouchet, I've mixed them up. I'll be a
little more thoughtfull next time.

From: Maurits van de Kamp <james.t.kirk@enterprise.nasa.gov>
Date: Mon, 21 Jul 2003 10:11:28 +0200

Hi Maurits,

>If Joe is one of those people who gets scared off by a site with too
>many letters and not enough piccies, he shouldn't be using a computer in
>the first place (or at least ask a more educated family member to
>configure it for him). RPM really is really easier than any other
>installer I ever saw in Tos, Magic, Windoze or any other system.

Joe his family members unfortunately all have the same IQ as Joe (it runs in the family), so they can't figure it out either. You see, Joe bought his Atari to play games on, after years someone told and showed him how to turn it into a word processor. Joe is very proud that he can write letters now with 1st Word, in fact he can't stop bragging about it...
As long as no one tells Joe that his Atari is able to access the internet, he'll be offline and go to the local internet cafe, screwing up the PC's there.

>Don't complain until you tried. Don't just look at the site and feel
>scared by the fact that you have to read something.

Well, Joe's English isn't very good. He prefers surfing to websites in his own lingo, which in this particular case happens to be Dutch. He also doesn't understand much of computer lingo. He does know the difference between a mouse and a joystick (after someone explained it to him), but we should go easy on him.

>If what scared you (or Joe) is the stuff you have to do to get RPM going
>in the first place (bootstrapping), look at EasyMiNT first. It installs
>MiNT with RPM without any real effort from your side. But you already
>knew this, because as you told me, you already know the latest
>installers. Right? :)

No, not right
Joe doesn't understand the difference between MiNT, freeMiNT, SpareMiNT and easyMiNT... He doesn't really know where to find everything he needs, according to Joe, the stuff seems to be scattered all over the internet.

OK Maurits... let's get serious now :-)
I admit that my Joe Average story is a little over the top, but I happen to know a couple of Atari users who resemble Joe quite a lot. And these people have no idea about the progress that's been made on this platform, MagiC and MiNT passed them by. Their knowledge has stopped with the last published Dutch magazine... If people like these would come in here, they would think we're from a different planet... and still these people are

the majority of Atari users.
Quite regular I get a phonecall from people who were once members of the local ex-Atari club. When they call, it's panic. You wouldn't believe the configurations and software I've seen over the last year.... But they all have one thing in common, none have moved on, and no one uses their Atari to access internet. I've met people who after using their Atari for 12 years still don't have a hard disk. Don't even mention CD's to them, they don't know we can attach these to our Atari's.... what strikes me is that most of them have got a PC or Mac, but keep doing things on their Atari because they happen to like the apps or/and the way the machine works. All these apps are minimum 7 years old.... you have no idea what people are using to accomplish whatever it is they want to do. The best way to describe is to say that as far as they are concerned the clock stopped when Atari went down. Their trusted Atari dealer became a PC or Mac dealer and they followed, merely following the advice from that dealer.

I've seen a 14Mb Falcon running MultiTOS, SpeedoGDOS and Papyrus 3.0, the owner produces a monthly newsletter with it which is read by almost 400 people, and you know, it really looks good.... :-/
Who in the world am I to say to that guy :"let's trash this bunch of crap and install some decent software on it"? When he popped the question to me about the advantages, I told him that it would be more stable and a little faster... he told me :"no need, the computer is fast enough to my likings and it has never ever crashed on me" !!

Well Maurits, with a lot of brainwashing I could perhaps persuade him to install MagiC, after all, it's only a diskette he needs to pop in the Falcon to install it. But I know for a 100% that there's no way I could ever brainwash him into installing and using MiNT. People like him really need something very simple.... and that's what ASH supplied years on end, easy to install apps. And putting MiNt on a easy to install CD won't work either... most of these people don't even have a CD-player.

They've stopped where we started, but when we're talking about the Atari platform we *have* to include them as well. Without them what's left of this platform? a couple of hundred users? unfortunately that's not enough to be a platform :-/

Although I had a go at the dreamers dreaming up dreams, I confess I have a couple of dreams as well. One of these dreams is to at least get some of those "Joe's" actively back on this platform. I converted a couple already, they are MagiC users now, not power users, but at least they can tap a little bit more out their computer now... there's absolutely no way I could convert one single user back if I should put a MiNT setup on his machine... in time they may learn about MiNT and decide to try it out, but it will take a lot of patience and a lot of time... time which we unfortunately haven't got anymore. So, it's essential to keep this platform going that new software can run at least under MagiC and if possible also under TOS. If only to make sure that all the Joe's remain here, we need them to be a platform... no one in the real world will take a (devided) group with a couple of hundred people seriously...

Cheers from Belgium
Dennis

http://www.coazter.com/fdn/ers.htm

Spirit is just as about as subjective as color, look, or speed. To this day
I know of people using monochrome, or who are quite willing to wait 24 hours
for 3D renderings, whilst the next guy with a machine with color and double
the speed find all that unacceptable. Needless to say, the fact remains
that MiNT was introduced by the company known as Atari. So it can be seen
the other way around. Magic has far less spirit to me, as it's roots are
not even from the company, in my opinion MiNT has more spirit. It's totally
subjective and borders on personal preference anyway. Although, my
preference is based more on the company's own path. ;-)

Hi

I'm looking for somewhere to get some atari ST floppies, i.e. double sided double density (DSDD).

I only want about 10 or 20 of them.

Any clues?

Thanks
Toby

SURE, there is only one way to use a Falcon expand card with CT60 !
The expand card must receive a MAL/MAL HE13/14 type connectors (in fact two
: one with 2 x 30 pins and one with 2 x 50 pins) .
Soldering these connectors on the solders of the femal connectors is not
difficult, just a bit long...
And it works ! :-))

One thing you need to keep in mind when analysing bombs.. sometimes the error traps will follow each other very quickly, so 5 bombs might be a divide by zero, but it might also be an address error immediately followed by a bus error or vv. :)

(I prefer MiNT's way of blurting out all kinds of info about the crash into the console.. although the bombs of course look cuter). :)

Maurits.

If you only want em for games then just use HD floppies, cover up the hole
and format them with Fcopy or similar on the Atari. I have hundreds of DD's
but theyre all in storage, so it works for me.

Smeg.

I have a CrazyDots2 card in my TT030 and the only thing needed to drive it
is NVDI v5, nothing else. Works really well. Straightforward simple
to install, setup is a snap.

The Nova which I owned before that (1mb version), required disabling some
part of NVDI if you wished to use them together. So you had more to load
at boot up. It's all german, at least the package I had.

I had the Nova for sometime, unloaded it for the CrazyDots2.
The problem with the Nova is not the hardware, but the software.
NVDI was getting updated, the Nova stuff seems dead in the water, so
if you have any bug issues, you are on your own for the most part. Also the
Nova drivers are not exactly 060 clean.

Wow, this is some in-depth discussion. Kind of a good example for what I said about why Magic-MiNT discussions always end up silly.

<irony>Sorry, I can't go into details, but Magic sucks and MiNT rules.</irony>

:)

Although another way to describe Magic-MiNT wars is "My apples are better than your oranges". Especially when people start to compare Magic's AES to MiNT's kernel etc.

Enjoy the rest of the discussion. :)

Maurits.

Obviously sold by someone who was giving up altogether. Since I've still got
my main Falcon I'm hanging on to all my software - so that means that this
machine is being sold with none.

I've found a decent-sized IDE drive for it now, and a club project tonight
will see the NVRAM chip replaced by Steve Sweet.

If anyone wants to offer me something near the price I suggested spaek now;
otherwise it's off to eBay.

I'll be a little slow responding to email and messages in here until after
the weekend.

I'm currently having a Christmas in July Sale! This is how it works. Buy the HardWare/Accessories for any Classic Atari 8 Bit and/or 16/32 Bit Atari ST System and I'll outfit your system with Games/SoftWare and/or Books/References. You be good to me and I'll be good to you! The more you spend on HardWare/Accessories, the better I outfit your system. The more HardWare you buy for your system, the more Games/Software and/or Books/References you receive! You choose the Atari Hardware you want to buy and we choose the Books/References and/or Games/Software I'll include in your Order.This will be a good opportunity to renew lost interest in collecting Atari or building a New Atari system for the first time. ReLive your Atari Youth! Offered While supplies last. Goto http://BensCatalogs.Atari.org or Call Ben anytime at (503)256-9974!!! To proceed with offer HotLink to:

http://www.aracnet.com/~atari/specials.htm Atari Specials!
http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!
http://www.aracnet.com/~atari/maillist.htm SignUp for Ben's Mail List!
http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

The best (in my opinion) TT compatible game I can think of is the
color version of Shocker II, which is specially designed for the TT
(and also the Falcon). Don't download the mono version, it is ugly.
The only downside is that you have to buy a codebook from Germany to
get past level 10, but 10 levels will keep you busy for a long time.
If you like Oxyd, you'll love this game. Basically it is a brain
twisting marble puzzle/adventure with gillions of levels. It is one of
my favorite games of all time on any system. -SaTcom2

Indeed.
Heaven forbid you learn anything or correct a myth.
It appears there will soon be 100 or so Falcon users with better
benchmarks than any clone, so they can re-aim their negative vibes
at other Atari users even more capable of running MiNT.
What was the minimum memory, 32 or 64mb? What a bunch of spoiled
brats those users will be. ;-)

>and MiNT 1.12. Which is why it's impossible to have a normal, serious
>and in-depth discussion about Magic functionality vs MiNT functionality.
>Which is why it always ends up in flamewars.

Imagine....
You are someone who's been using MagiC for years on end running on one single machine and that you don't really need to hook that machine up to other computers, be it from the same or a different platform. You use the computer for accessing the internet (mail, news, ftp and a bit surfing) with a dialup connection using MagiC only dedicated clients.
You also on occasions run Calamus, Papyrus, Artworx, Papillon and some of the other well known apps. And all in all you're pretty pleased with the computer and the apps... One fine day someone tells you that you should give MiNT a try because it has more functionality, it has more advanced features and because it is open source you can rest assured that the development will continue for many years to come. Like any normal person would do, you decide to give it at least a go. After all, the specs really look impressive compared to MagiC. You do your homework first, surf to a couple of MiNT dedicated websites, download a lot of docs, read and study them and brace yourself. As someone who always used MagiC, from what you've been reading in those docs and seen on the websites, this isn't kidstuff!! You've never encountered unix before, at your office it's all PC and Mac, so it all seems very daunting to you. One thing you already know is that you'll have to read some unix docs also, if only to know what some of the apps are used for. You've seen stuff to download with names like pine and samba but haven't got the faintest clue what exactly these are, and on the websites and the docs it's assumed you already know.... as far as you are concerned samba is a latin dance. But then you don't want to stagnate with MagiC and want to move forward into the 21st century also, like as you've been told so many did before you.

You download the GEM RPM shell, set up the whole lot, and then finally you download the latest MiNT RPM package. You've been told that the installation is very easy, and all is taken care off for you... it's a good thing you did some research first, otherwise you wouldn't have known

that you need an additional desktop and AES to get it running... The first hurdle to overcome is finding N.AES 2.0, there aren't many dealers around anymore, and most don't stock it. It's not exactly cheap either for what after all is only a AES. You decide to use Jinnee as desktop, since you've already have it and don't want to spend extra money on Thing. It's not the money which is the issue but the fact that with every new program you install, there's a learning curve involved, and since you have a lot to learn. Anyway, after fiddling a little with N.AES and trying to get Jinnee to display the icons correctly in 16/24 resolutions, MiNT is up and running!!

You can't use the Iconnect clients which you know inside out anymore, but that's not a problem, you've been told that these clients weren't much to shout about to begin with and that there's a wealth of free apps available, you can even use STiNG/STiK clients if you prefer to do so... after a very short time you realise that your iconnect clients aren't all that bad as some would like you to believe... it's not a problem really, because if you want to go online all you need to do is reboot the computer and start MagiC up.

You've anticipated a couple of problems while switching to MiNT, but nothing like this... your trusty reliable stable Calamus SL95, keeps crashing. You've been told that your Calamus is outdated and you need to update it. When you ask why it doesn't run correctly under MiNT all of a sudden, you're being told it's a dirty hack... Atari is a hobby for you, and you have a family to support.... and the budget is in the red this month, you really can't afford to spend 200 EUR updating it, so you reboot the computer and boot Calamus in MagiC.

Papillon your trusted reliable and stable graphic package, works perfectly except when you wanna print something... for some reason the printer dialog isn't displayed completely, you ask why and are told it's because of WDialog, that's another dirty hack you're told, you should remove it and use NDialog which is 100% compatible... you find out very soon that it may be 100% compatible but doesn't has all the features of WDialog, as a result of this, some of your apps really behave weird.... but that's not a problem either, all you have to do is reboot and start MagiC up....

To justify the Atari to your wife you do the home accounts and budget on it with Texel (spreadsheet). Texel works together with Artworx to display the graphic charts, you've even wrote a nice ASH Scripter script for it, what it basically does is to take the data from a Texel file and represents it as a plot in Artworx. No one has an idea how long you've slaved over that script to get it working correctly. You're not a programmer and writing a script doesn't really come natural. The very first thing you notice is that Artworx can only reproduce the plots in gray scales now, and to make matters even worser.... your script all of a sudden doesn't work anymore. You're being told that ASH scripter is also a dirty hack and to trash it. But that doesn't make Artworx print coloured graphs and pies ofcourse, so you reboot the computer and start MagiC up....

DO I HAVE TO GO ON???????
I can give you at least another hundred examples of how the combination MiNT/NAES fucks up....

>Which is why it's impossible to have a normal, serious and in-depth
>discussion about Magic functionality vs MiNT functionality.
>Which is why it always ends up in flamewars.

It's partly true... but it's also because the above mentioned problems are always swept under the table. MagiC users are being told that MiNT is 100% compatible with TOS, and that every GEM application which runs under TOS and MagiC runs just as fine under MiNT. The average user isn't interested in knowing why it all of a sudden doesn't run like it should anymore, all he knows it that he's not getting the same functionality from *some* apps and in the end that's all what matters. You can't expect that everyone here has the very latest version of a program, some of us don't care or have other priorities. Switching from one OS to another should give one at least certain advantages, in this particular case there are no advantages. The GEM apps won't run any better then they did before, in the worst scenario some won't run at all or severely hampered... And even if one takes in account that MiNT is capable of running ported open source apps, then he should be told not to expect the present day applications running, not because MiNT can't handle it but because of the hardware that can't cope.... MiNT is clearly superior over MagiC featurewise but in day to day use with the existing software base, it's not noticeable at all. The open source software which has been ported only attracts and is suitable for a small fraction of the users. Switching to a different OS is more then just installing the files, to get to know it inside out and reap the benefits, a lot of hours need to be invested and lots of docs need to be read...
Note that I'm talking as your average day to day Atari user now , power users will find MiNT more suited because of it's network capabilities and ready to run open source software to accomplish the task. But also note that these power users are a very small minority among the Atari users, they should consider and realise that not every one has the same needs and setups. I would say that for someone using his computer running the average day to day used applications it doesn't make one cent difference which multitasking OS is installed, they both perform equally well. For someone switching from TOS to a multitasking OS however it's a different story because the migration will be a lot more easier with MagiC. And although MagiC is commercial, one should not forget that N.AES and Thing aren't free either, all in all when starting from scratch it will cost the same amount of money.

If we like it or not but most of the favourite apps on this platform have been developed with MagiC in mind. The programmers have exploited some of its features to the maximum. These apps run just fine under MiNT also, but don't stand out. And that's what's missing.... apps that have been written with MiNT in mind, I don't mean the ported stuff but real GEM apps wich run under the three OS's *and* have an edge when running under MiNT. As long as nothing like this appears, discussions like these will never stop.

Oh... I have a USB based DSL connection here, now if any of the MiNT power users could explain me how on earth I get this thing attached to my Atari TT or Milan060 without the need of networking it to a Mac, they might just convince me to start using MiNT.... at least for internet use. Are there (ported) DSL drivers available for MiNTNet?
As always, the big problem is a hardware issue, on occasions the programmer of MagiC follows this group, if by chance he's reading this, he might come here himself and explain his views on the topic.... IIRC he once told me that he doesn't want to implement things in MagiC which the hardware (in this case real Atari hardware) can't access or use. If tomorrow someone releases a clone whch is really succesfull, MagiC will follow suit and support all the features of the hardware just like it supports any port on any real Atari right now.

Well Maurits, I've at least tried to be objective. But without a shadow of a doubt I'll be accused by some here of lying, being biased, insulting all the MiNT users and people developing software for it etc.. so yes I agree that an in-depth discussion is impossible.

Cheers from belgium
Dennis

From: Janez Valant <swe@atari.org>
Date: Sun, 20 Jul 2003 17:18:45 +0200

Hi Janez,

>>I hope these examples are enough to convince you that I don't just
>>target MiNters... if you need more examples just yell, over the years
>>I've spoken my peace a lot of times in here :-)
>>
>Yes they are. Im now totaly convinced that any reasoning with you is
>futile. Period. U are the grand jury and the judge. I am also 100%
>convinced u do hate MiNT and all related to it, UNLESS they are total
>quiet or even say bad things bout MiNT.

None, and I repeat none of the examples have anything to do with MiNT at all. And it hasn't got anything to do with me liking to play judge either. It has everything to do about my rights as a customer. Take Draconis Pro for example; after reading a couple of (biased) reviews, taking a look at the website and seeing even more promises being made there. I decided to join the club of happy Draconis Pro users and bought it, the only reason for me to wanting this software was it's *advertised* ability of being able to cope with JS pages... I'm not going to explain it all over again, lots have been written about it in this group. What it comes down to is that me the customer has been cheated... I would never have bought it knowing it's so called JS ability only existed in the programmer his head. I've got in touch with the programmer and got a lot of bull back... my setup wasn't right, his 100 betatesters never encountered a problem, I should stop using my graphic card etc. And according to what I've been reading here I wasn't the only one receiving those bullshit replies. And you know what? I was even stupid enough to buy the upgrades to version 2.6 and 2.7, Yep, I said buy.... these upgrades weren't free either. All in all I've spend some 150 Euro on that piece of crap. And before you have a go, YES this gives me the right to complain. If my ranting about this piece of crap in here prevented even only one guy to waste his money also then I think I did a pretty good thing...
Depending on your views it's also a way of caring for this community. Have you forgotten about the PhotoTip and Porthos threads?

>In long posts i sent, u carefully only reply on parts u can use to bash..

I realise and admit that I've done some selective quoting, the last few weeks and especially in this thread. So what? We all do it... look at all the posts this thread and a couple of other related threads generated the last two weeks. Do you think I can reply to all these posts in full? I'm sorry Janez for not having enough spare time, put in plain English: I haven't got all day to reply to all those posts, hell it's difficult enough

to read and digest them all. So I can do two things, don't reply at all or apply some selective quoting... and let's face it, it's all been said and done before. As it is right now, my replies lag behind some two odd days. People mailing me are even put on hold, I'm sorry, but there's only so much one can do in a couple of hours a day. It's brilliant weather outside, and here's me sitting behind a computer!! How stupid can one be?

>and in most cases those are "i dont need that os its useless to me" Yes
>it may be useless to you, but what about the REST of us?

When will you ever realise that I speak for myself, not for the community. You ask my opinion and I give you my personal opinion. I'm not speaking for a group of users, people with different views are free to join the thread and air them. Why do you treat me as though I'm the exclusive spokesperson for a whole group?

>U dont care bout fact MiNT is ATARI, and Unix part is hacked, not Atari
>part, u dont care the fact that MiNT GCC produce totaly valid TOS or TTP
>executables (there u may hate or dont wana use them as u want, they ARE
>proper Atari platofrm applications). U dont care we repetitvely say that
>Unix apps are ADDITON to existing and fully functional Atari envoirment,
>whuch is priority in MiNT..

True... and again that's my view, not the view of *all* MagiC users. Should I interprete all you say as the exclusive view of all MiNT have? I think not, so why on earth do you regard me as the MagiC users voice?

>In one message u said (probably careless) that there is little
>in line, as new apps are concerning. Yet with abvious lack of new apps, u
>hate and dismis any app whuch aint pure Atari app. In same spirit u also
>"overlook" our opinion that we dont prefer alien apps over GEM ones, but
>sadly thats all we have.

Look, you had a go at me because I say that the remaining bunch of Atari programmers can't cut it anymore. As an example you give me people who devote their time in porting over software originating from a different platform. I've been told that porting software over is just a matter of taking a source from the net and compiling it... I'm not a programmer, so I wouldn't have the faintest clue, but if that is all it takes, then no Janez, I don't regard these people as programmers. If none of your bunch is able to write a decent GEM program, "sadly" as you call it, well then it's "sadly" time you draw conclusions. I drew mine sometime ago. You don't like hearing them so you want me to shut up. Sorry, but as long as I don't see any results of all this babbling and dreaming out loud, you will find me on your path.

>>Janez, interest hasn't got anything to do with it, the very first thing
>>one should consider is :"what can i do with these ", well, except
>>perhaps for cjpeg/djpeg nothing of the above mentioned utilities are
>>usefull to me, the fact that they are free or/and written by MiNTers has
>>got nothing to do with it. I'm not going to get rid of something I've
>>been using for years on end and served me well. So Pop3 Gem and tarit

>>are out, the MiNT setter and RPM are of no use since they're for a OS I
>>do not use.
>
>Thank you for this. Yes i also do think on many apps "What can i do with
>these" and in many cases i realy dont use them. However, i never BASH
>authors and their intention, and i still respect their work. And major
>problem with u is that as soon u found on app u do not like, no matter
>that author need to put sweat into it, u will bash author, OS and anyone
>who may actualy like it. Who the fuck cares if u dont need/like TARit and
>MiNT setter?

True, nobody gives a "fuck" if I need TARit or MiNTsetter. But you're the one who specifically wanted to know. And you also knew very well what reply these examples would generate. It's like me asking a MiNT user here what he thinks about MagiC-configurator (freeware), his reply would be more or less the same as mine was: "it's of no use since it's for a OS I do not use"... the only difference is that I wouldn't accuse him of bashing the author who put lots of sweat in it. The problem here Janez is that I reply in black & white, and you like to get a "grey" reply. As a user I'm only bothered with the end result, and I comment on the end result. Take QED for example.... I've used it for many years, but the last two years I've switched to Luna, QED is open source now, Luna is freeware. For me the user that makes no difference, they're both free... Do you honestly think that I've dropped QED in favour for Luna because of it's open source status? I didn't, Luna is constantly developed further and improved, QED has come to a standstill. Luna has a list of features a mile long, most of these are missing in QED. So on a one to one comparisation, Luna wins it. And that's the main difference between the two of us. I don't really care how much sweat it has costed to develop QED, do you think the author of Luna doesn't sweat?

>They were created for ppl, who have wish to try MiNT, to make their
>live easier.. Still not a gram of good thought to those coders from you.

But why do you want me to have any good thoughts for these coders? their efforts don't affect me in any way. Hell, why would I even be remotely interested in what they've coded?

>I dont need any MIDI app for example, but im still proud we have/had apps
>like CAF, Notator, etc...

Without realising it, you've just put your foot in the problem... "have/had" are the crucial words here, almost all that MIDI stuff, and certainly the "big" titles were commercial. Thousands of people have left this platform because of the lack of *modern* Midi software. And no, I'm not proud about it, what's there to be proud about? The fact that we have a 10 years old hopelessly outdated CAF and Notator on this platform, which only runs stable under SingleTOS?

>FACT is, existance of tar archiver (of which usage is as it seems a
>mistery to you),

I have a tar, rar, gzip and other packer/unpackers here on my harddisk waiting. If I ever need to use them, it will be with one of the scripter files from Dick Meulendijk. As far as I am concerned, TARit is just another example of reinventing the wheel...

>MiNT setter or RPM does not harm anyone. It actualy bring Tar, installing
>RPMs onto GEM level, same as app u happen to like does (Anodyne stuff).

Did I ever say those apps hurted anyone? I just don't have a need for them, I don't even know if I can run them, but despite that you still want to hear me say that they're great?
OK fine: THEY ARE GREAT !!!! satisfied now?

>And on end, as much u hate Lonny or Frederic, they do stand behind those
>apps and i also know few happy Airc users on Magic.. They did those apps,
>they added to comunity, u did what? U hate them, deny all their work

I've told you before that I do not hate anyone, you automatically assume that if I don't agree with someone I hate him. I don't agree with Frederic and Lonny their views, so what? They don't agree to mine either. And you don't like my views either... following your logic Frederic, Lonny and you hate me and I should hate them in return?
Outgrow kintergarten Janez!!!

>and maybe ull use your enermous knowledge and translate airc RSC
>files. That will realy bust Atari scene enormously.. Maybe we need to stop
>coding algorythms, just provide u with RSC files?

Oh boy.... the main reason I never touched airc is because it's in English already, if it wouldn't be, Lonny would have received a mail from Derryck, Peter or me explaining what we do and ask his permission and coorporation to translate his work... I could offer to translate it in German, Dutch and French ofcourse, but I won't because then I would have to go against my principles. I believe strongly that English should be the universal computer language, non native English speaking people, who wanna work with a computer should make the effort to grasp at least the basics of the language...
Being a fan of Lonny and Frederick has nothing to do with it, it doesn't make one cent difference to me who coded what, and the status of the app doesn't come in play either.... if we (DDP) get the permission and also the coorporation of the author we're in business. Liking or disliking the programmer has nothing to do with it. It helps ofcourse if the translator and programmer get on well, but it's not really necessary. I've worked with programmers that were real pricks (they'll remain anonymous) and I also worked with people where the relationship was wonderfull. I don't have to "like someone" to translate his code...
Oh, about airc... I'm not into IRC, according to Lonny I wouldn't last five minutes in there, but as a MagiC *and* Iconnect user, if I would attempt it, I would use ASH Chatter. Derryck and me translated it, and thus know it inside out...

>Look. Using an alien application on native Atari OS cant be called
>forgetting origins. Creating TAR or RPM pr whatewer shell also.

Have you ever asked yourself the question who has a need on this platform for TAR and RPM? Like I said... I for one have no need for these, real atari apps don't need a TAR or RPM treatment. So from where I am sitting these shells are indeed a waste of time. The people who coded them could have used that time and put their efforts in developing something where the whole community benefits from.... it also makes me wonder why the users of TAR need a shell, according to you CLI's are a godsgiven thing. If someone likes using unix stuff, he should go all the way :-)

>BUT how low can u go Dennis? How hipocritic can u be? In many messages i
>DIDsay that MiNT is very RAM and HDD hungry. I also said that i am realist
>and that i do recomend Magic to all who asked me, if they havent TT with
>FASTram, or Falcon with 14, preferably more.. Except if they have big with
>to try Unix..

I can step even lower and be even more "hipocritic"...
These days I don't advice anyone anymore to switch, and certainly not to people with a TT or expanded Falcon. If someone want to have a go at Unix then I'll advice him to try it on a PC or Mac, he'll enjoy it lots more and has literally tens of thousand apps available to play with. Until last year I gave someone wanting to go online with cable or DSL the advice to switch, but since that 3th party hack (MagiCNet) has arrived that's not necessary anymore either. In fact, MagiCNet goes a step further and allows to run Iconnect clients, so it's even more versatile now then MiNTNet ;-)

>Also u overlooked, that there is MultiTOS like setuo (1.15.4 kernel, N.AES
>and Thing boots with 2.5mb free ram here, less as magic, but not
>unusable). If u boot with kernel ONLY, and only use some MiNT goodies with
>single tos AES, u dont even notice MiNT...

I didn't overlook it, but one should go all the way IMO. You either have enough RAM to enjoy using a multi-tasking OS or you don't. And advising someone with only 4Mb to use either MagiC or MiNT, is something that I never did... to enjoy what multitasking is all about, 4Mb simply isn't enough, no matter if MagiC or MiNT are used.

>Im firmly convinced that u do overlook these points (not some small hiden
>ones, in some odd topic) on purpose, and purpose is to deny all what we
>stand for and enforce your supremacy over me and others....

I've just explained you very briefly why I overlook those arguments. It's my believe if someone makes the switch from SingleTOS to either MagiC or MiNT, he should be able to reap the benefits. And in addition I also want him to enjoy what Atari computing is all about. If I set up someone his installation it's like this. The very first thing I do is give NVDI a *minimum* 1MB cache for the TTF fonts, that'll speed up rendering of the fonts enormously. The next thing is the disk cache of HD Driver, which I set to "eat" roughly 500Kb, same thing for the CD-R(W) driver... since printing is dead slow on this platform, IMO a spooler is a necessity, and a spooler configured to hardly use any memory is worthless. Since we're only human and we all like "nice" stuff, I'll problably also install OLGA, STARTmeUP, a OS specific taskbar and some other goodies on that computer. ST-Guide and a CPX manager are a necessity also on any computer. Depending

on the guy his needs and likings I'll probably put some memory hungry RSC's with coloured icons on his hard disk also, that's another 1MB gone into oblivion. And then we haven't even touched the subject of constantly usefull and not so usefull utilities.... if that guy happens to like a couple of ACC's, he should still be alllowed to use them. If he happens to like seeing a clock in his menubar or whatever he should be able to.
Well, I know we're different Janez, but there's no way I'm going to advice someone to use a multitasking OS just for the sake of it and as the result of this has to work with a crippled computer, constantly having to keep an eye on how much memory he has left... that's not what I define as Atari computing. And for once it doesn't even matter which multitasking OS is favoured.

>What do u know bout ACP after all? I dont now claim it will 100% happen,
>but i saw evaluation board from Motorola ACP at EIL, saw many ppl working
>hard on it, sav SuperVidel guys.. They DO work on it.

Did I say it doesn't work? I'm a realistic person, when that dream machine is in the shops, then I'll believe it. I saw a working Milan 2 running at ProTOS in Neuss, but that doesn't mean a thing, the Milan 2 is vapourware. It doesn't matter one little bit to me how many people are working hard on it, the end result is what matters.... it doesn't exist yet, it's not for sale, so as far as I am concerned it's vapourware. Discussing stuff that *could* or could *not* run on it is nonsense and a waste of time. One of the reasons that a lot of commercial programmers turned their back on this platform was the Milan 2, a lot of them were working for it also, and some lost a great deal of money because of that. Put your energy in things that are already here, not in dreams. Learn lessons from people who've fallen in the same trap before. Over the years we've seen enough announcements, trucks full in fact, of stuff that would come to this platform. If only a small fraction would have appeared..... as far as Atari is concerned, I only believe it when I see it.

>I also remeber u and Uwe here said that CT60 wont ever happen. Same was
>said for Highwire. HW is not finished, yet, ppl are working hard, and u
>again took liberty to comment that in your own style. U and Uwe tend to
>declare all nonsense... Well in some u were right, in others u wasnt..
>CT60 already sit in my machine.

Well you don't remember it correctly. Uwe and me agreed that the xTOS was nonsense, but AFAIK we never ever commented on the CT-60. I know it would be released once, in receiving prepaid orders the developer has commited himself to build it.

>>(There is no hardware ready to buy at the moment which is capable of
>>running the setup you propose comfortable. So come back advocating this
>>system once that the ACP materialises. But then I'm sure we're going to
>>have a discussion about value for money....
>
>Value for money? What value? Face it, developers are gone, not because of
>MiNT, but because hardware was stucked, there was no proper internet (and
>mint declared and named all sorts of view) so they migrated..

How much will that ready to run machine cost?
Face this: In some odd five years all in all some 2000 clones have been sold. The Hades never really was a cheap machine, but the Milan could be bought for as little a 750 EUR. A DIY person could even buy the motherboard with the necessary bits and pieces for 500 EUR. And still, in spite of the relatively low price, it wasn't an instant success. Ever wondered why? Do you remember the posts from Rudolphe and how long it took before he finally found a mere 150 people wanting a CT-60 card?
It's sad, but the majority of users on this platform doesn't want to spend money on new hardware, and the faster you realise this the better. One of the reasons Atari went down has to do with this also. There used to be a couple of million ST users, when Atari released the TT and the Falcon only a very small fraction bought them. Atari constantly had to find new users, because the existing userbase let them down. And don't give me the price argument... computers from different platforms used to cost lots of money also in those days. Hell, back in 1988 I saw a 68040 expansion for sale at a German Atari computer show for the MegaST, and I saw a lot more coming and going on this platform. I've seen wonderfull graphic cards, memory expansions, processor upgrades, ethernet cards etc... you name it and somewhere someone has made it. The problem was always the same: people didn't want to know about it and didn't buy all that wonderfull stuff and so most of the companies or individuals who produced hardware add-ons for Atari have lost money on it. So does it surprise you that they've stopped developing stuff for this platform? Even today, I still have to do my utter best to convince someone of the benefits of using a graphic card....

Now suppose that the ACP would be for sale tomorrow, do you honestly think that me and a lot of other sound thinking people are going to spend minimum $1500 on a computer that can only run the existing apps a little faster? If that's what you're thinking.... you're in for a nasty surprise. Just like most people, my needs and priorities have changed over the years. And although that the ACP machine *could* possibly meet my needs I know it'll never be standing on my desk. Gone are the days when I was impressed with the specs of hardware, what counts now is what can run on that hardware. And that's the department where something very seriously is wrong.... with our existing software we won't attract one single new user, and MiNT being able to run a handfull of unix apps won't make the slightest difference. I've just realised that someone buying that computer can't even connnect a scanner, DVD-R, CD-RW, a graphic card or even a stupid printer which he prefers using to it, because there are no drivers. Hell, this must be the only platform left where there's no driver for a DVD-R, not to mention a DVD- writer. No one produces SCSI writers anymore, if I need a new writer next year, I'm stuck...
You realise I hope that if someone here wants to know about scanning, that the only advice we can give him is to hunt on eBay for a ten years old scanner, because lack of suitable drivers. We have to be content these days with the write offs from other people !!!
And then you are surprised that I have a go at those big mouths which come in here regularly bragging about all they do? You even want me to pay them respect.... NO WAY!!! these people program for themselves, not for this community, if it so happens that someone else can use their apps, fine, if

not, tough... they don't think for one little minute about what apps or utilities are most needed at all. If one of them needs a better newsreader then we'll have one on this platform (and we need a good newsreader that works on all OS's and stacks on this platform!!). If however he wants a better mailer, then we'll have another one to add to the pile. That's not serving the community, it's just a touch of luck that some other people can use it as well. The majority of users are left in the cold.

>here is lack of new hardware (ACP guys work hard, but
>HW development is hard and exp tho), lack of new software (developers
>migrated to platforms with bigger userbase etc) and yet, u took any
>oportunity to bash developers still remained, since they have will to work
>and maybe a bit diferent ideas as u.

If you would for once react to what i've actually wrote instead of reacting to what you *THINK* I've wrote that would be an enormous improvement. I had a go at the big mouths coming here bragging about all they do and are going to do.... I NEVER had a go at the *whole* community of developers and programmers, why should I? These people get my respect, because they deserve it and earned it, the big mouths here however...

>I want still to use my Atari in many years. Not like u, who uses xx for
>years and u dont need more.. and stagnate. I will use my Ataris in further
>years, ill get exited by any new HW announced, i wont dismiss any like u
>do, ill be disapointed many times, for sure, but thats life..

Well I'm not the masochistic type. And disapointments don't belong to life themself, one should avoid being disapointed in the first place, a good way is not to expect too much...

>U dont want life, u want vegetation. If prize for using Ataris or machines
>yet to come is some alien app or driver, its price i must pay... U will
>sit, each year with less developers, and curse and laughter on anyone who
>will try to make a difference..

Well then I'll probably stagnate at one point or the other. Not that it matters much, the stuff that runs right now on it, will work just as well in five years from now. And you can stick your alien one OS driver only, where it hurts... I also have MagiCMac here, that baby copes just beautifully with all kinds of interfaces and drivers, and yes it doesn't run on a real Atari, but then that clone I've got here gathering dust, isn't a real Atari either. And before you have go at me for using a mac with an emulator sometimes: I'm fedup having to wait half a lifetime before my printer finishes an A4 color print under NVDI. Under MagiCMac using the same program the printer prints that same page in a couple of minutes using the Mac printerdriver, and on top of that the prints look much better as well. Last year my scanner gave up on me, I've bought another Epson, a very expensive model with a SCSI and Firewire model, the scanner itself is a dream to work with but on the Atari no go... the ancient Epson scanner drivers don't wanna know about it, so whenever I need to scan anything... MagiCMac comes to the rescue.
That's the beauty of MagiCMac, in contrast to other emulators it allows one

to make full use of all the hardware inside and connected to the Mac. And it doesn't make one cent difference if that hardware happens to be connected to a USB or Firewire interface..
I'm not trying anyone to convert here to use a Mac, but it makes one thinks. I've got this expensive clone here gathering dust, nothing wrong with the machine itself, but I can't attach anything fairly recent on it, because the necessary drivers are missing... and believe it or not Janez, that ACP dream machine is bound to suffer from the same illness.

>Not only that u
>dont create (except occsianly mess with RSCs etc) but u also have balls to
>laugh, and slack anyone who try to make any diference, no matter if he is
>on end very or little or not succsfull. U will take any oportunity to deny
>him at start already.

For the very last time Janez: I DO NOT slack EVERYONE who tries to make a difference. I just target some bragging dreamers who regularly think they have to tell us just how valuable they are and how greatfull this community should be. IMO they don't do anything for this community, what they've coded is strictly for personal use, if someone out there happens to be able to use it also, then he's in luck.
A well visited page like MyAtari or ST-Computer should organize a poll, and ask the users what kind of apps and drivers they are realy waiting for... and then the programmers should follow suit, that's how I define "doing a lot for this community".

>All what i (we) want is recognition that MiNT is capable, that is future on

>more powerfull machines, and on machines yet to come, if they will come of
>course. And that there are users with TTs with TT ramcards, ct2 and AB040
>machines, CT60 machines ...

Have I ever said it isn't capable? Like usual you've probably only read the part where I said that it was being let down by a poor AES. And why on earth would a fast Falcon be better, it's still that same crappy N.AES running on top of MiNT...

>Any rasoning from me about ACP was folowed with "providingly ACP becomes
>reality". ACP or AtariONE etc name is not important, important is that MiNT

>with GCC can offer instant lib of new apps, esp protocols etc so machine
>can live, sine can be used... Later developers sure will implement those
>new things into GEM apps, same like Didier does etc. If u wish to declare
>any attempt as useless, stupid or nonsense from start its ok, dont poison
>all others with that.

I'm kind of getting deja vu feelings here. Remember the Milan 1? That computer came with MiNT/N.AES as standard installed OS. So in a manner of speaking this community has a MiNT computer already. And some 600 people bought a copy of MilanMagiC (that's about 60%). Why? Do you really think that all these people are MiNT haters? Why does someone spend an extra 175 EUR if his brandnew computer comes shipped with a fully installed MiNT setup? Even a full version of Thing was included. And why was is that the

vapourware computer Milan 2 would come installed with MilanMagiC as the standard OS?

You have the same problem as Lonny, you both seem to talk only with people that share your views or more or less have the same opinion about how this platform should move on. Stop taking the displayed attitude in CSAST as being the only thruth, it really isn't. The majority of users doesn't even know there's such a thing as CSAST. In the real world out there, for every 20 Atari's running MagiC there's one machine running an ill-configured MiNT. And the users of these computers are even less remotely interested that somewhere there's a bloke sweating on porting another nice app, which is useless to them.... then I am.

And that Janez concludes this long post, as you can see I've replied in full to it. In fact it took so long of my time that all the others will have to wait for a reply. if I decide to reply that is. All we're discussing right now has been discussed here last year, two years ago, three years ago etc.

Cheers from Belgium
Dennis

Date: Sun, 20 Jul 2003 17:47:02 -0500

Hi Frederic,

>Big correction that shows you don't know what you're talking about.
>I did full mint/kgmd (aes included) install on megaste (tos 2.05), it
>worked perfectly fine. The problem is that once you have everything
>running, you can't run more than 1 GEM application at a time (unless it
>is a small one). So it defeats the purpose of multitasking OS.

Your big correction, turns out not to be so big after all (you've had me worried there for a minute). I didn't say you couldn't install it or that it wouldn't work fine. I've said that because of memory limitations one wouldn't get a proper setup, in a different post I've explained what a "proper setup" means to me. Anyway we've both said the same thing, but phrased it differently. We do agree that installing a multitasking OS on such hardware defeats the puprose.

>Now, to really prove you wrong, you say:
>> On a expanded Falcon with 14Mb one won't run
>> very far either....
>
>I say: I'll take "Total bullshit for $800, Alex".

If one really wants to go all the way, 14Mb won't take him very far. My setup for example garbles 8.5Mb away during booting, the same setup under MiNT/N.AES needs nearly 10Mb. Suppose I would wanna do something with Calamus and Papyrus in whatever there's left.... it's not possible, or I have to trim things out, and that defeats the purpose of multitasking also.

>>It doesn't make one cent difference if the discussed player is open
>>source or shareware, they both can't perform miracles on a 68030
>>without DSP. So if I say ported open source software like this is of no
>>use to me.... there's no need to go berzerk, try to see it from where
>>I'm sitting. In practice only people with Falcons and clones can use
>>these players.
>
>You don't make no sense.
>As stupid as a gamer complaining to ID because Doom 3 won't run on his
>pentium 133Mhz and S3 video card.

I wouldn't make any sense if the majority of users would be sitting behind a clone or Falcon, however that's not the case. And even here in CSAST the overall setup of the users doesn't match these specs. To phrase

it like you did: the majority of users actually still work with a P133,
and for some a S3 card is even the top...

>Well, guess what, software come with pre-reqs, Can't work miracle.

Gee... why didn't I think of that myself !!!

>2) if he was a so called gamer, he would have something a little more
>21st century.

He might if there were more then just a handfull available...

>3) very nice to "insult" Didier's effort as it makes his work totally
>useless to the community as only the "privileged" ones (mind you, the
>people who spent a little money on their hardware, to exactly achieve
>things they couldn't) will be able to enjoy.

I didn't "insult" Didier his work in any way. Aniplayer in contrast to
those dedicated mp3 players can do a hell of a lot more then just play
MP3's. It can also handle DivX movies.... should we discuss these? The
number of "priveleged" who can watch these films running at full speed
will dwindle down even more... Why hasn't anyone ported a dedicated DivX
player yet? Could it be that unlike the mp3 player that software won't be
able to perform miracles on an expanded Falcon or 060based clone?

>>And to make this post a little OS specific: supposing that a TT would
>>be able to play mp3's, then using MagiC as OS would put a little less
>>strain on the processor vs MiNT...
>
>How the hell do you know?????
>Have you ever benchmarked it, ran some test? some stressloading?
>News to you, I have used both heavily, and can already tell you that
>actually Aniplay feelt smoother, the whole computer was smoother.

Yep I did....
Aniplayer converting a mp3 into Wav on a TT is some 4% faster under MagiC
then under MiNT.... 4% may not be a lot, but we're talking hours here,
not split seconds.
Aniplayer running a DivX film on a TT with Nova Mach64 and fastRAM card
displays it in slow motion at about 0.75 frames a second under MagiC.
Under MiNT one sees the same clip passing buy at 0.50 frames per sec. And
that is more then a difference of 4%, I haven't figured out why yet, but
some here undoubtedly will...

>Once again, if you don't know, just shut it.

Ofcourse... I'm sorry. I'll go back watching that nice film again, it
should take about 32 hours to see it in full.
Or I could watch it roll by under MagiCMac at full speed (28fps) while
only putting 10% strain maximum on the processor. That's the difference
between Didier and your coders, he doesn't come bragging in here about
what is possible on Atari... for these kinds of tasks he always refers to
speeds on his own Mac running MagiCMac.

>Freaking unbelievable.

It sure is... especially if you try to play that same film on a clone
with 060 processor, Aniplayer sqeezes out an amazing 9 frames per sec,
great, here I am, one of the "priveleged" watching his life go buy in
freaking slow motion...
BTW: you still haven't told us how long it takes to convert a standard
audio track into glorious mp3, or better yet a full audio cd... you
should try it once. You won't feel priveleged for very long.

Cheers from Belgium
Dennis

>kernel and N.AES, without Unix envoirment, thats just another mtasking OS,
>native of course.. So what do i miss here, what Atari spirit may be
>diffrent from that? :)

Janez unfortunately forgot to tell that some apps running under MiNT/N.AES
will look rather weird...
Let's take a real Atari application as example. The very first thing that a
MagiC user will notice is that the taskbar of Papyrus looks different, gone
are the coloured icons under MiNT/N.AES they're in brilliant black & white.
And don't come telling me that coloured icons aren't important, I couldn't
care less if the taskbar is displayed in monochrome or colour, but it's just
one example to show how N.AES fucks up. Because Wdialog is a dirty hack, the
N.AES developers wrote a "clone" called NDialog. The problem however is that
some vital routines are missing, so don't be surprised if some apps that run
correctly under SingleTOS and MagiC all of a sudden "forget" to draw or
redraw something, not to mention if you wanna print with certain software.
Another problem of N.AES is that is seems to have difficulties displaying
certain types of dialog boxes which are displayed perfectly under both TOS
and MagiC. The technical reasons why all of the above is happening doesn't
really matter to the end user, he's stuck with them... N.AES 2.0 is nearly
five years old now, not even one little tiny bugfix has been released. And
then there are quite a lot of utilities available which also work perfect
under SingleTOS and MagiC, Janez won't like this but these utilities don't
work either or not the way the programmer intended them to.

So if Janez says that MiNT can run all native GEM apps just as good as
MagiC can, technically he's right, he just forgot to add that some apps
behave really weird. Which according to all what has been posted here lately
shouldn't be happening at all... why TOS and MagiC get it right and MiNT
don't isn't important, except for the user ofcourse... he has to put up
with it. Last year someone complained that his Calamus didn't work at all
under MiNT/N.AES, guess what kind of help he was offered :" get a newer
version"... disregarding the fact how much Calamus costs, a OS boasting to
be 100% compatible? Oh, did I mention that the non-running Calamus worked
perfectly under MagiC ;-)
So the conclusion is really simple: if anyone needs the extra non-compatible

unix like options of MiNT, by all means install it. If you're a more down to earth user stick to what you've got, it'll save you a lot of headaches not to mention money...

Oh and that famous Atari spirit:
Janez doesn't know it anymore, he has forgotten how it looks like. It can only be viewed and enjoyed under SingleTOS and MagiC. The combination of MiNT/N.AES screws up the look of Atari apps. It displays them differently then the programmer intended, one could say that N.AES automatically reverse engineers them <very fat grin>

Cheers from Belgium
Dennis

> who don't benefit from this solution. I propose the Adaptec SCSI ==>
> USB kit.

The Adaptec device does not do what you think it does. It is a USB to SCSI adapter, not a SCSI to USB adapter. USB to X (X = SCSI, parallel port, serial port etc.) adapters rarely if ever work in reverse. The USB interface chips used in such peripherals usually cannot be anything other than a USB device (in other words they cannot act as the host for a USB bus).

There are a few fairly recent USB microcontrollers which can be switched between being a host and a device, but typically once put into actual products they're still limited to one direction, by firmware if nothing else. And they're not usually used in mass market products because they're more expensive than the simpler single purpose chips.

It may be possible to design a SCSI to USB adapter, but if you're doing your own hardware you might as well do it right and interface a USB host controller IC to something simpler like the ST cartridge port. The hardware would be simpler and cheaper, a better target for driver authors, and would likely be faster (a SCSI transaction for every USB host controller register access doesn't sound like a great idea). It should also be able to take advantage of driver work done for USB PCI cards, especially if the people doing that driver make sure to use macros to abstract away register access.

(posted & mailed since this response is coming long after the initial thread)

Totally? Well that means attacking anyone, calling MiNT developers loosers, same for anyone who dared to develop or use any application which dont pass the grand jury in shape of Dennis? Why the F**** then we bother anyway.. U will all enter the new millenium with apps developed by Dennis and colleagues. thanx for all support... From this moment, i dont care anymore, why GGT2 and last version of Graoumf (yes some loosers still use trackers) with my AES friendly modification, have some troubles. After a year or so, of seeking for problem, i see its futile... U may think this is overreacting, but Dennis wont call me looser, or compare me to anyone. Its not sad u do like Magic, its sad u support the insulting etc of productive ppl and that on disliking and hatery base only...

520 STFM, 1/2mb ram, SS internal drive, psu cables, manual
External Cumana DS external drive
Soldered boot switch in STFM body between internal and external
Euromax Pro joystick (the only unbreakable joystick made?) & Logic3 mouse
Quite a few games (Starglider 1+2, CSB, RanaRama...)
Loads of Automation disks and the like (about 100)
Magazines to go with.

Cant justify it being in the garage anymore, I'm not likely to use the
hardware
anymore to play Chaos Strikes Back, Bombuzal, Carrier Command & Oids :-(
Must play with the emu's more!

Offers please. Postage will be at cost, UK preferred

Cheers

why isn't RPM working on magic?
There's no reason it wouldn't.
Unless Magic is lacking some OS calls.
Would be pretty nice to have a standard packager for atari (all OS).

Hold your horses here.

First you say: "a real atari application", then you mention Papyrus.
I am sorry, but once again you are displaying your ignorance.

in papyrus code. let's say it has something like this: (in plain english
for you).

```
set icon=monochrome
if cookie = magic found
then:
check for resolution/color,
if >= 16 col
set icon=colors
endif
endif
```

Do understand that?

This is biased coding, but guess what, we'll never know and never be able
to fix it as the code is not available.

Atari when releasing one of the latest AES released some example code (src
and binary) on how to use toolbar, icons etc.
They ALL worked on ALL OS, color or not. (magic, singletos (provided the
AES was recent enough) and mint/naes).

That is the standard that was set. Explain to me why Papyrus did not use
the code that Atari released?
Please give me a GOOD answer, do not ignore this one!.

> care less if the taskbar is displayed in monochrome or colour, but it's just
> one example to show how N.AES fucks up. Because Wdialog is a dirty hack, the

naes fucks up, I like that. Read comments I made above.
Naes does not fuck up anything.
Papyrus author could have used the standard way to use toolbars with color
icons with select and all. Why didn't he? Please explain.

yeah, which totally defeat your whole argument of using magic on an
STF 1meg. Pretending to multitask is definitely "in" in 2003.
Other than the "cool" factor, what's up?

> >3) very nice to "insult" Didier's effort as it makes his work totally

It is an indirect insult.
aniplayer claims mp3 and divx, your answer; totally useless coz 80% of the
people use atari stf 2meg anyway, oupdidoo!

Once again, you mix hardware and software in a software/OS discussion.
Nice way to shield your poor arguments.

> I can give you at least another hundred examples of how the combination
> MiNT/NAES fucks up....

What you are definitely NOT understanding is that:

1) your examples are very poor because you are trying to run magic/ash
apps in another OS.
As in, has ANY MiNT user complained that rpm wouldn't work in magic?
This is as dumb.

2) you are showing that those magic/ash application are not clean, and
when one app (calamus) cleaned it own code, you claim that this is not
good coz you don't want to upgrade.

3) you should realize that this is a marketing technique (which is 1
reason I do not appreciate magic) that was used MANY MANY times, microsoft
for example with MS-DOS. As in, windows would only work correctly on
MS-DOS version. why? was MS-DOS superior to DR-DOS? please do some
research.
Magic has changed the behavior of some of its API, why? no apparent
reason, this split the OS market, and we come to this, texel not working
right with any OS other than magic. If you answer that it's because magic
is superior, you are a moron.

4) Many people respect the original Atari spirit which was broken years
ago by magic, that pisses me off and find ourself in the midst of this
big giant mess.

Your examples are ridiculous, I could create a better example story about
a mint/naes user trying to go to magic, and guess what, MORE things would
be lost, we are not talking about the icon not showing quite correctly, we
are talking about crashing the system, or not running at all, because
magic has to trim down its code or it won't fit on a floppy anymore, nor
run on 1meg ST.

See, if magic (as buggy as it is) was to respect the APIs already in place
and follow a more standard way of doing things, then it would be awesome,
and I would have NO problem at all with magic, really.

The DR-DOS <> MS-DOS story always pisses me off, same thing with MiNT <>
MagiC.

The difference is that Magic can't claim ignorance as a simple look at the
code to mint's internal, and bam, same features.

>
> It's partly true... but it's also because the above mentioned problems are
> always swept under the table. MagiC users are being told that MiNT is 100%
> compatible with TOS, and that every GEM application which runs under TOS
> and MagiC runs just as fine under MiNT. The average user isn't interested
> in knowing why it all of a sudden doesn't run like it should anymore, all
> he knows it that he's not getting the same functionality from *some* apps

All GEM apps that follow atari's way (API) will run in singletos, magic
and mint perfectly.
If you write a GEM app with magic in mind, that's what you gonna get.

<snip>..
> should be told not to expect the present day applications running, not
> because MiNT can't handle it but because of the hardware that can't
> cope.... MiNT is clearly superior over MagiC featurewise but in day to day
> use with the existing software base, it's not noticeable at all. The open

not only featurewise as you say, but in the design and its implementation as well.

> source software which has been ported only attracts and is suitable for a
> small fraction of the users.
This is as irrelevant as saying:
I am not a musician, so I don't care about the MIDI sockets, or cubase compatibility.
You are correct, you shouldn't care, but this is totally irrelevant to the discussion. Please stick to the thread.
Some people need database (maybe 2%), some people need internet access (30%), some people might play games, some people might JUST write a book they are working on. whatever their needs. It's fine by me.
ICQ might only be used by 1% of atari users, but who to thank? GPL. Thank you.

SQL, maybe 2% too, thank you GPL.
etc etc.

Now I am actually a little confused, what are MagiC users, or Dennis complaining about?

MagiC is 100% great as they say and all their software run great and they don't need any other tools as they are either useless, or have a better magic/GEM replacement. So everything's great, right?
Please leave the "more" experienced user play with MiNT, Unix and more recent hardware, just don't expect anything from it I guess, as magic is clearly a different market all in all, as Dennis so elegantly demonstrated.

```
if cookie = magic
exit() // no need for magic users to use my application
// as they have better GEM alternative anyway
// and this unix port is useless to them
```

That's my signature :P

Someone put it best, they prefer to use their Atari's like they did 10 years ago. They let one person have complete control over how it's done. No it's not Dennis, the author of magic has them by the balls. It seems to come down to memory limits when Dennis gets worked up, so I guess they are stuck. Someday, maybe magic 7 will appear with all the missing bits I currently come to rely on, but until then it's MiNT all the way.

Please do, it's entertaining and it keeps you busy.
So far, all the apps you listed I don't use, totally worthless to me.
That is the criteria, if it's of some value to me, whoever finds it
worthless apparently is brillant. lol

For that I would switch into virtual consoles setup (without GEM). I still have multitasking (CLI only, but it is OK for me) but I do not have GEM overhead. I doubt Magic can convert waves to mp3 faster than such setup.

False. For example several versions of Ndialog has been released. Also, some people test beta versions.

> perfectly under MagiC ;-)

Crappy code (yes, even Calamus can have crappy code!) is no excuse. There are rules, and if you do not follow them, you may in deep trouble.

I do not remember exactly what was the Calamus problem, but I remeber it was sometching about files. Let us think how Magic and FreeMiNT handle filenames. Under Magic, filenames are case-insensitive what means that file named readme.txt and README.TXT is the same file. Under FreeMiNT, on TOSfs partitions it is also true, but on minix on ext2 partitions (wait, one momment can MagiC read minix or ext2?) filenames are case-sensitive. Some programs often change casing of filenames, for example making them all uppercase (to be honest I once written program that did such thing). That is very wrong and such program may be not able to acces files from case-sensitive partition. That is a bug.

> Oh and that famous Atari spirit:

> then the programmer intended, one could say that N.AES automatically reverse
> engineers them <very fat grin>

Lets look how MagiC screws up application look. Each application running under MagiC or FreeMiNT has its own entry in the Desk menu. When application

starts it is a filename, but later application, using a simple AES call can change it. This call was introduced in very early MultiAES aroun 92' or so. Gues what, MagiC does not support this tiny feature. Several versions (sincs 92') were released, but non support it. It is legal, documented in Atari documentation. Excuses anyone?

>I bet you have never used it, nor seen it in your life, but already the
>assumption that it will be any less of an atari with atari software.

Brainwashing? Moi?
If you ask me Frederic that post was one of the more sensible ones, he doesn't say he dislikes unix, in fact he has it running on 4 different PC's... and he can enjoy using *all* the open source apps, no problems on that platform to port something over because the hardware can't handle it.

Turn and twist it as much as you like but this platform is not suited for that kind of software, just because a marginally small fraction of the open source software can be ported doesn't mean we should embrace it, and certainly not call it the future of this platform.
I don't need to brainwash anyone.... it should be clear to every sensible guy in here that NSPIRIT followed the only correct route.

>Great. Misinformation, exactly why Dennis is not my best friend.

Imagine we would be neighbours, fun for the whole neighbourhood would be guaranteed :-)

>>run with NVDI, and they perform equally well under MagiC, MiNT and singleTOS
>>
>Dennis that's definitely not true ....
>Crazy Dots cards are good I used one and even expanded one to thousands
>colors .... It even was possible to use the card with NVDI and it was great !

Hohoho... hold the horses.
I didn't say that it wasn't good, I said that the Nova card is better. If he's lucky enough to find a card they'll both be priced similarly. The Nova cards with ATI Mach32 or Mach64 accelerator are lots faster then the Crazy Dots cards and in addition can all display up to 24bit (millions of colours). The Crazy Dots cards are hardly faster then the original TT graphics and can only manage 16bit (thousands of colours).
So on a one to one comparisation the Nova cards win handsdown, which doesn't mean if someone has the chance to get a Crazy Dots card he should let it pass, anything is better then being stuck to the original TT graphics.

Cheers from Belgium
Dennis

>opinion MiNT has more spirit. It's totally subjective and borders on
>personal preference anyway. Although, my preference is based more on the
>company's own path. ;-)

It all depends from where you're sitting and how you view it. In one hand
for example there's Atari US where the computers were developed and in the
other hand there's Atari Europe who's main purpose was to try selling the
American products to the European punters. The people in the Sunnyvale
Atari HQ didn't have a clue about how different the European market was to
their home market and time and time again they goofed. Anyone with common
business sense would have transfered the *complete* computer divison over
to Europe, preferably to Germany where truly amazing things were produced
in an attempt to disguise the crap that Atari USA was trying to shove in
our ****. They goofed with the hardware but the software division was even
worser, how many Atari branded titles are running on your computer? Except
for TOS which I can't dump there's nothing here branded Atari....

Here's a small story to reflect on:
Back in 1993 I received a visitors pass from Atari Belgium for the German
Cebit Messe (the largest computer show of Europe for business users). I
drove all the way up to Hannover and attented it. Atari Germany was there
in full force and had one of the largest stands. And not one single STe or
MegaSTE in sight, there were at least 50 TT's and Falcons showing off what
they were capable off. And yes, the whole lot was pretty impressive back
in those days. There wasn't one single TT running MultiTOS on that show,
they were all running on MagiC 3.0... even Atari Germany didn't want to
know about it and pushed a OS that didn't originate from Atari. This was a
show for professionals, the last thing Atari Germany wanted was to be not
taken seriously. IIRC there wasn't one single copy of Atari Works to be
seen either, another piece of art...
Now, considering that the major software developers were German and that
Atari Germany pushed MagiC as the only to be used multitasking OS, does it
really surprise you that the software written by these developers were
geared towards exploiting MagiC? Programs which frequently are called
"dirty hacks" here were programmed between 1994-1997, in those days most
of the German developers didn't even know about MiNT....

If Atari Germany (the European HQ) would have had their way, MagiC would have been the offical multitasking OS and would have shipped with the computers, just like they had their way with GFA Basic and later on Omikron Basic, while in the US and UK people found ST-Basic and ST-logo packed with their computer, in Germany and the Benelux countries they included GFA Basic. I presume you agree that this was a rather wise decision ? :-)

The Atari software division hasn't really made much of an impact, except for MetaDOS nothing withstood the test of time. Do you remember that truly awfull SpeedoGDOS? That's another thing which never has been pushed by the European branch of Atari... NVDI already existed in those days, and the Germans knew the difference between good software and crap. To compete with the likes of the PC and Mac platforms they needed the best software around and show that the Atari hardware could handle it also...

To return back on topic, I don't really agree that MiNT was introduced by the company known as Atari. MiNT already existed, in 1992 they realised that to compete with the other platforms they needed a multitasking OS also, and they needed it in a hurry.... no time to develop something from scratch themselves, so they bought MiNT, reversed engineered it somewhat and slapped their AES on it, and the result was MultiTOS, and we all know how good it is. If the software divison would have been based in Europe (where it really belonged) then you can bet anything you've got that they would have bought MagiC... and we wouldn't be discussing the virtues of two different OS's right now.

The Atari 16 bit computers have never really been popular in the US, but the software kept coming from Sunnyvale... and time and time again they goofed. Remember when Atari sold the MegaST bundle (the SLM 804 and the Timeworks DTP bundle) for an attractive price? Not here.. in the Benelux countries and Germany Timeworks was replaced by Calamus 1.09. Remember MS Word for Atari not to mention Word Perfect? Not here, we already had Tempus Word Pro which was ahead of its time.
When I write "1st Base" every German Atari user knows that I mean a cute, easy to use database, which is lightning fast. Until this very day I've never seen a database on any platform which can handle and sort data faster... Some jewels have been programmed for this platform and they are unknown to most of the atari users, simply because Atari Sunnyvale didn't want to know about it... we can't change history, but we can guess how things would have looked like if only...

>although, my preference is based more on the company's own path. ;-)

Like I said it depends on where you're sitting and view it. Atari not only goofed with their hardware but also with the software. They bought MiNT and messed it up calling it MultiTOS, MiNT as we now know it hasn't really a lot do to with Atari anymore, if it would then you wouldn't be using it at all. Those meatballs who shoved MultiTOS in our throats would probably don't even recognise it if they saw it, and no Janez, Lonny and Frederic I'm not having a go at MiNT...
What you need to remember of all this is that MagiC had an edge of almost five years in Europe and especially Germany. Another thing to consider is

that magiC is a German based OS, all the docs are in German. That's quite handy for a German programmer :-) Atari Sunnyvale was known not be really generous when handing out specs on hardware or software, not to mention that these were all in English. So, considering all this and also that MagiC was distributed by the largest software distributor, does it really surprise you that it made such an impact?

Cheers from Belgium
Dennis

>I have a CrazyDots2 card in my TT030 and the only thing needed to drive it
>is NVDI v5, nothing else. Works really well. Straightforward simple
>to install, setup is a snap.

True, but because of that it's only marginally faster then the original TT
graphics.

>The Nova which I owned before that (1mb version), required disabling some
>part of NVDI if you wished to use them together. So you had more to load
>at boot up. It's all german, at least the package I had.

The Nova drivers replace the VDI, but if NVDI is present will use certain
routines from it also. If NVDI is loaded then its screendrivers need to be
disabled.
More recent versions of the Nova setup program do this automatically now, all
the user needs to do is click "ok".

>I had the Nova for sometime, unloaded it for the CrazyDots2. The problem with
>the Nova is not the hardware, but the software. NVDI was getting updated, the
>Nova stuff seems dead in the water, so if you have any bug issues, you are on
>your own for the most part.

The last update (2.67) is from 1998, in that period we saw NVDI 5.0 coming
along also. I never really encountered a lot of problems with the software,
some very old software accessing the screen directly can cause problems, but
then MagiC doesn't like these apps very much either.
I have more problems with the S3 card driver in the clone then I've ever had
with the Nova card and I had several cards (1Mb Mach32, 2Mb Mach64 and 4MB
Mach64 with Vram).

>Also the Nova drivers are not exactly 060 clean.

I wouldn't have a clue, but you shouldn't blame Nova (Computerinsel) for this,
the drivers are hacked with permission. A bit like MagiC-Hades really, that one
is a hacked with permission of the author version also.

Cheers from belgium
Dennis

> So on a one to one comparisation the Nova cards win handsdown, which doesn't

I'm not so sure about this... OK, the Nova is faster, a lot faster too,
but it does have more problems with "dirty" apps than Crazy Dots. The
reason for this is Nova VDI. It's not a bad VDI at all, but there are
problems with apps that write directly to the framebuffer or use offscreen
bitmaps. NVDI's offscreen bitmaps really doesn't work well when there's an
underlying VDI. With the Crazy Dots there's no such problems, as NVDI has
a driver for this card. There are still some problems with apps that
writes directly to the framebuffer, but these are far between now.

I've had some graphics cards now, and in my experience nothing can beat a
Crazy Dots when it comes to compatibility and usability. MVDI (for the
Milan with the S2-card) is a close second, it works surprisingly
well. Nova VDI is third, with fVDI last (but lots of things has happened
to fVDI since I stopped using it two years ago).

Well i can explain what i definately dont miss, and thats 2 hdd crashes, with MBR fecked, so HDD was unusable. I also dont miss "FATALER FEHLER: SYSTEM OVERSCHREIBEN" (fatal error: system overwritten) throwed at me at boot time. And someone said memory protection is not needed :)

The crazydots unit in my TT and the one sold both handled 24bit video.
Please research the cards, you will find you are incorrect.

Dennis doesn't do any coding, but he thinks he knows all this coding level stuff. Yet Magic is the one the doesn't follow the standards, especially in the documented look of 3d objects. I have the developer docs directly from Atari, with example code and the works. Anyone that says magic does these things correctly simply ignores fasts and documents from Atari.

Hi there!

Just my two cents on the Mint/Magic argument... I've used both, and I like both for certain reasons and certain applications. But overall, I think the core thing for me is this: I like Mint for its Unix capabilities and overall power, which Magic doesn't quite match (yet), and I like Magic for its far superior (in my opinion, other than its lack of AES 4.1 support and lack of support for >6 accessory slots) GUI and small size (and thus faster speed, for some applications).

What I'd *love* to see, though, would be a combination of the two. I'd like to see ASH/B&B release a version of the Magic GUI that runs on the Mint kernal. That way, we'd have the functionality and power of Mint, with the visual "wow" factor of Magic. Of course, they'd have to upgrade it to AES 4.1-compatibility and allow more than just 6 accessory slots for me to really be 100% happy with it (these have been some of my pet peeves about Magic ever since I got it).

Someone at some point said that Magic *is* capable of running Mint-only software. Well, I did some testing. I installed a fairly full Mint setup, and copied the Unix file structure to a non-ext2 drive. I then used Link2U to define everything correctly on Magic's U: drive. While the software does actually run in most cases, much of it only seems to recognize the ext2 filesystem (won't find files even if they're there, and defined correctly on the U: drive), and some require a newer terminal emulation than vt52, which is all that Magic has. *Please* tell me if anyone knows of a TOSWIN-like application that runs on Magic with vt100 or better emulation! TOSWIN2 won't run because it really requires AES 4.1 instead of Magic's meager AES 3 compatibility.

Yeah, I'll probably get flamed for saying that, but what else is new in this discussion? Anyway, like I said: just my two cents...

Hi

I used Mupfel shell a LOT in Magic. Its decent shell. VERY Unix like and lotsa Unix programs (MiNT) runs happy with it. Its not actual merging of MiNT and Magic, but definately makes life easier. Also i dont think it supports vt100. There was alternative program to TW2, i think it was called Farmer... U could try it.

Who really cares, that's not the issue, you have fallen for the BS Dennis spews out. What I find pathetic is the replies regarding my hades, stealing, and now comments about someones mother. I can ask a direct question such as do you feel this is the correct way to carry on a discussion? Not one of you so called Dennis supporters will even admit that crap is out of line. As soon as Dennis and Steve stoop to this level they lost their ability to effectively be taken serious.

Why do you think so? My personal experience is that there's no speed difference for such tasks. The reason is simple - such tasks doesn't use the OS at all! So if the computer doesn't do anything else (and it can't if the comparison should be fair) the difference will be very, very small. Based on my experience with Aniplayer on my Milan060 I'd guess that Aniplayer would use somewhere between 20 and 30 seconds to decode a 1Mb mp3-file. The difference between MiNT and MagiC in this case would be very close to zero. I can't say which OS will "win" such a contest.

That will never happen, simply because MagiC really doesn't separate the AES and GEMDOS. E.g. threads in MagiC is implemented in the AES. I really haven't studied the internal design of MagiC that much (mostly because... well... you can't basically.), but to me this seems to be necessary due to the way AK wanted to make the whole thing thread-safe.

> Someone at some point said that Magic *is* capable of running

Only up to a point. It lacks several things for this to be really useful. But with MagiCnet and a fake MiNT-cookie installed you can do a lot of the same things as in MiNT, if you know what you're doing. I played a lot with MagiC on my TT, but "the real thing" (MiNT) works a lot better for me. I have several computers with different operating systems (Win2k, Win98, MacOS, Linux...) in addition to my Ataris, and really need MiNT to get things to work together. And I like to tinker ;-)

> drive. While the software does actually run in most cases, much of it
> only seems to recognize the ext2 filesystem (won't find files even if
> they're there, and defined correctly on the U: drive), and some

The problem is that there is no case sensitive filesystem for MagiC, and many recently ported unix-apps requires this.

> require a newer terminal emulation than vt52, which is all that Magic
> has. *Please* tell me if anyone knows of a TOSWIN-like application
> that runs on Magic with vt100 or better emulation! TOSWIN2 won't run

I don't think there is.

> because it really requires AES 4.1 instead of Magic's meager AES 3
> compatibility.

I used to hack TosWin a bit some years ago, and IIRC it requires ttys (which MagiC doesn't have). So it's not the AES that prevents it from working under MagiC.

Very true. MagiC draws the 3D-effects inside the object, while Atari's 3D AES draws a border around this. Both methods has pros and cons, but the most obvious one (and the one thing that users really notice), is that apps developed under MagiC and not tested under any other OS, can look weird. They will only look as intended under MagiC.

However, I'm not sure if Atari had released any docs (or even a 3D AES) when this was developed for MagiC. So one can understand why AK sticked to his own design.

I am not sure myself, but I would goto Tim Hardy's MIDI website
and see if it is there or else Tim Hardy himself.

I just got Gemvelope to work on the Hades using NVDI. Works just great. I will be using it alot in the future. I love the bar code option, that will come in very handy. Anyone use it? Eventhough it is freeware, I still may send in my money. I was planning on getting it when it was commercial, then I bought my Hades and I just forgot about it. Nice program....

DO YOUR RESEARCH,

We do have one. It's called ARAnyM. It's more or less a Falcon emulator
with JIT acceleration (very very fast), Ethernet, high
resolution/high color video and xbios sound through linux. It's an
all-in-wonder machine. Does everything you're looking for for sure.

When its been sold on ebay perhaps you'd pop back here and laugh at the nay-sayers!.
Its up to the prospective buyer what they'd pay for it.

As a side issue i must comment on how tidy it actually was, and now its got a working clock module its fully saleable.

IMO the drive issue is a non-issue as it'd be way to small for my use so I'd bin it anyway!, as would any prospective buyer of that specific class of machine IMO.

I used the term 'hack' as that is the theme of the site and also the
authours chosen (part)title, but rest assured they are Hardware hacks, some
very usefull one's at that. As i recal it was very anti piracy as well but
either way it was strictly hardware oriented/

Ah ah ah ..... rotfl Dennis ......
I do like to come back in the past because some people here are so funny
....
All in all atari community is always fun .... not like before of course,
but they keep some unrivalled behaviour.

Let's say that's why I come from time to time and read some of the
articles here ..... but when my eyes meet your name I cannot avoid to
read because I know very well you have some wisdom and your relative
regard is one of the most interesting here.
Computing for an average user like me absolutely must keep some fun
otherwise this matter is far too serious for people like me.
Sometimes I do remember the time when I was the webmaster of UTSI .....
Today this situation will never happen again.
I prefer to use and create with tools rather than collectionning them.

All my respects Dennis.

Jo

Hi, John!

JG> >http://www.nvdi.de/gb/Produkte.html

The Behne brothers seem to be out of business IMHO.

So if you want to order NVDI get in touch with atari dealers.

ASH has been the "major" NVDI dealer, so if you fail to get in touch with the Behnes or to find an atari dealer in your country, try here:

<http://www.application-systems.de/nvdi/index.html>

It's german only, sorry. There is a link to the online shop and to the latest freshup If you need assistance, let me know.

If you already own a NVDI Version 5 then you can find the latest freshup (V 5.03) on the Behnes' site as well:

<http://www.nvdi.de/gb/News.html>

Regards,

Alexander

5012. A strange mouse problem

Newsgroup: comp.sys.atari.st
Date: 2003-07-27 14:34:40 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <bg0nu0bjs1@thorium.cix.co.uk>
Source record: 25194

Hi!

Came across a strange problem when a new member brought one of his Falcons up to the club (Chesham Computer Club) this week, which I though might be helpful to others:

He had only recently bought it second-hand, and when booted off the hard drive (which had a lot of software already installed) everything worked fine at first. But as soon as you changed the screen resolution (to ST med or any other SVGA mode from the one at boot-up), the mouse refused to work. One could still move the cursor with the Alt+arrow keys, but even a substituted known-good mouse refused to work

After disabling all ACCS and AUTO apps and reinstalling them individually, the culprit turned out to be NEMESIS.PRG and/or NEM_HI.PRG. Without these all was fine. I can only presume that this was because the Nemesis board was not fitted to this machine - he wasn't sure as he has two Falcons, one of which at least has it built in. Or it could be faulty/wrongly installed, I guess.

This is a public service announcement in case anyone else finds they have a similar problem.

Regards, /Peter/

The hack site hacked ? No, but beginning of July, one week after the
site looked like dead, I put an online copy to be found here :

http://atari4ever.free.fr/hardware/

I might re-arrange the whole and add other documents I have of my own or
collected elsewhere.

I haven' t tried to contact the author of the site since the pages have
been sleeping since 1999 and all contributions are public domain (well,
not really up to the Atari schematics I guess)

By the way, does somebody have a better name instead of hardware HACKS ?
like hardware tricks or do-it-yourself ?

Fred

5016. Re: ST's and Autobooting HD? Can I format HD FAT?

Hello Uwe,

US> With MagiC or MINT you can read and write PC-
> compatible FAT or FAT32 partitions.

That's interesting. Would I boot the MiNT kernel from a small TOS partition and then have that mount a larger FAT / FAT32 partition? If so, is that also the way that minix (I don't know what other filesystems MiNT now supports) partitions are handled?

I would be interested in learning how the Atari boot procedure works. I think the PC loads a master boot record from the first sector of a hard disk, and then runs it. If I understand correctly the master boot record contains (or perhaps loads) a partition map. Unless a boot selector program (e.g. bootselector, lilo) is in that first sector the partition that's marked 'active' has its boot record read, and then executed.

Does an Atari hard disk driver include a boot program that gets loaded from the disk and then executed, or is the driver more like a library of routines that TOS calls to access the drive? Perhaps both of those things?

US> Without MagiC or MiNT you can create a single (!)
> partition that is both PC and Atari compatible with
> HDDRIVER.

That's nice, I can imagine that being quite useful.

US> Note, however, that only one partition per hard disk
> drive is possible in this case. As the maximum
> partition size for the ST is 256 MB and for a MegaSTE
> /TT is 512 MB you would not be able to use the full
> capacity of your drive.

You mentioned that the 256 Mb ceiling was imposed by a (19-bit?) sector count limit. Is the 512 Mb ceiling similar or is it geometry related like PC IDE's old 528 / 504* Mb limit?

- Andy Ball *(504 Mb if 1Mb = 2^20 bytes)

5017. [ANN] Rage Screen Saver (1.0b)

Newsgroup: comp.sys.atari.st

Bonsoir :)

As always, download on my homepage http://rajah.atari.org
at the fVDI-Files chapter, or directly with the URL
http://membres.lycos.fr/nef/files/ -> ragecalm.zip (40 Ko)

Need:
- PCI ATI Mach64 compatible video card
- PCI Bios

This soft is a hard screen saver: after a period of
inactivity of the mouse (can't do it for keyboard),
the display of the PCI card is set to off and the
monitor should set itself in sleeping mode.

It was coded for my Falcon+Eclipse/ATI RageIIc and
Sony TFT M-51 monitor.
It may works on other systems, but without guaranty.

Read the doc, and USE IT AT YOUR OWN RISK.

The LST sources are given, you can do anything with them,
so you can learn how to access PCI card in GFA Basic ;p

Regards

Rajah Lone / Renaissance
http://rajah.atari.org

Good initiative. Hope you'll be able to contact the author.

5019. Colour printing with Epson 600

Newsgroup: comp.sys.atari.st
Date: 2003-07-27 20:38:18 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1059334908-423394AEicMi@adel6.freeserve.co.uk>
Source record: 25001

Hi All

I have a query about printing in colour on an Epson Stylus 600 Color printer I have using with PhotoTip 3.11Beta. According to the Epson manual this printer can print upto a maximum resolution of 1440x720dpi - but I have found that I cannot get the printer to print at anything like this res!

With PhotoTip and using the last NVDI (5.03) and a printer driver for the 600 it gives me the option of printing at the higher res (Best - 720 & Best - 1440) but when selected either all I get is a brief alert box flashing up on the screen "Initialising Printer" or somesuch, and then nothing happens!! The maximum res I can print at is Normal - 360dpi, even with the best glossy paper in the printer.

I have a Falcon CT2b with 14Mb and 64Mb FastRAM so I thought I must have enough memory for printing at the higher resolutions?

What am I doing wrong?

Also does the "Epson GDPS_SC" scanner driver which Dennis mentioned about recently work with both the Epson GT9500 and an Atari Falcon running Magic 6.20? I know it is shareware but where can it be obtained? I am interested in using it in conjunction with PhotoTip for scanning in old non-digital photos.

Thanks for your help!

Neil :-)

3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14Mb/1Gig/CD
Falcon 030 MkX CT2B 50MHz/78Mb/20Gig/CDRW
Atari Calculator (32 step recall!)

I'm just starting to learn how to use audiomaster from sound pool, and
I'm having some mental blocks about how to use it. (I've never used
any mastering prg. before, just CAF.) Would anyone be willing to help
me get started by answering some ignorant questions?

Thanks!

Wayne Martz

5022. Atari Falcon Issues...

Newsgroup: comp.sys.atari.st
Date: 2003-07-28 01:03:52 UTC
From: JagCube@yahoo.com
Message-ID: <83fbea98.0307271703.f580dfa@posting.google.com>
Source record: 25004

ARGH :)

Ok...

First, info on my falcon:

14MB RAM (NO FPU, but a 68882 is coming in the mail soon!)
CD-RW Yamaha (using CDFS w/extendos)
Running MiNT ? when possible ;)
VGA monitor and RGB sc1224 crap monitor

Now.. on to the problems....

It seems everything is riddled with problems! :(

There's only a handful of things I can run and those immiediate things
would be:

Super Fly and Chu Chu Rockets from Reservoir Gods.

Most other programs gives me a TOS #35 error(AHHHH) (which I have no
idea wtf it's talking about) and then I get the bombs..... then I
just get the freezing.
I tried programs in MiNT and then just in straight TOS.

Chu Chu Rockets and Super Fly seem to only work in MiNT so I have to
run that slow@ssmolasses program. I can't get NVDI 5 installed right
and NVDI 3 I have is zipped and does NOT want to
unzip for anything :(

I can't read german, that's a problem!

So, my screen is extremely slow! Most programs either will not run or
bomb/tos error out.
Then, there's some files I copied from my CD to the HD of the falcon,
these files will not go away at all!!! I can't delete them? Illegal
Function or if I drag to the trashcan it doesn't do anything, what
gives?

I'm not new to the Falcons it's just I've never had these problems
with any previous Falcons (except for 1 that was tricked out) and this
is just a standard falcon030.

Should an FPU help much at all? Maybe most programs require it?
I already have NVDI, but I can't get it installed? What can I do?

MagiC 5 or 6? which one should I go with? Can I get them in English?
(I dont want to mess with anything German, no good if I can't read
it!)

Also, will running Magic allow me to run all the atari programs that SHOULD run normally anyways but doens't?

Maybe there's something I'm doing wrong or need to change that I don't know about?

Any help is very much appreciated... I'm starting to get fed up with the machine yet
I want to be able to do so much with it.

Thanks guys....

Clint Thompson

Hi Adam,

>> N.AES 2.0 is nearly
>> five years old now, not even one little tiny bugfix has been released.
>
>False. For example several versions of Ndialog has been released. Also,
>some people test beta versions.

A beta version is vapourware as far as I am concerned. I've got a whole
partition full with beta versions that never saw the light of day. Thanks for
reminding me about the Ndialog bugfixes, unfortunately the problems remain...

>Crappy code (yes, even Calamus can have crappy code!) is no excuse. There
>are rules, and if you do not follow them, you may in deep trouble.

These rules didn't apply when Calamus was written, and since the code runs
perfectly under TOS and MagiC, I can only presume that MiNT has invented some
new rules, that explains a lot ofcourse....

>I do not remember exactly what was the Calamus problem, but I remeber it was
>sometching about files.

Not really, it locked up the computer completely, at random... perhaps a
different version had a problem with filenames?

>Let us think how Magic and FreeMiNT handle filenames. Under Magic, filenames
>are case-insensitive what means that file named readme.txt and README.TXT is
>the same file. Under FreeMiNT, on TOSfs partitions it is also true, but on
>minix on ext2 partitions (wait, one momment can MagiC read minix or ext2?)
>filenames are case-sensitive.

It's a nice theory, if there wasn't TOS which hasn't got any problems either
with Calamus. MagiC can't read or write to minix or ext2, it can read/write
FAT32, which IMO is much more versatile.... MiNT can handle it, and the Mac
and PC platforms also. So a hard disk formatted in FAT32 is interchangeable
between the three platforms.

>That is very wrong and such program may be not able to acces files from
>case-sensitive partition. That is a bug.

That's your definition...
You've just told me that there are rules, and if one doesn't follow them he
may be in trouble. I haven't got a clue TBH but I very much doubt that Atari
ever set rules for case-sensitive partions. Minix and ext2 are just as alien
as FAT32 is... These rules may have been set later on, but then why should

anyone follow them? Let's face it, until a couple of years ago MiNT wasn't in a position at all to set rules, and certainly not to define any standards.

>Lets look how MagiC screws up application look. Each application running
>under MagiC or FreeMiNT has its own entry in the Desk menu. When application
>starts it is a filename, but later application, using a simple AES call can
>change it. This call was introduced in very early MultiAES aroun 92' or so.
>Gues what, MagiC does not support this tiny feature. Several versions (sincs
>92') were released, but non support it. It is legal, documented in Atari
>documentation. Excuses anyone?

Why are you guys always referring to that crappy MultiAES introduced in 1992 and developed in 1991? MagiX has been around since 1989.... and like I said in a different post, hardly anyone took note of Atari their MultiAES. All the major softwarehouses and developers supported MagiX, some were even sponsored by Atari Europe to do so....I like to think of it as being pushed in the right direction.
It's only since MultiTOS disapearred and MiNT became open source that the wheels got in motion... unfortunately much too late. If you look at some of the programmers docs from MagiC you'll notice that the programmer sometimes went through great lenghts to make MagiC compatible with MiNT. He didn't have to, his OS was first and market leader, can the same be said for the MiNT developers? One example: MagiC introduced threads... MiNT got them now also but they're not compatible, would it really have been impossible to make them compatible?

Oh, I can't remember ever coming across an application that screws up the application looks under MagiC, you don't happen to know one?

Cheers from Belgium
Dennis

5025. Re: Linking a TT & Falcon via the lan port

Newsgroup: comp.sys.atari.st
Date: 2003-07-28 01:34:32 UTC
From: Andy Ball <not@valid.null>
Message-ID: <I4%Ua.1374$Bg.1262@newsread4.news.pas.earthlink.net>
Source record: 25005

Hello Rob,

Rob> 1) Can it simply be done by getting a cable and
> plugging into the lan ports on both machines...

I wouldn't be at all surprised to learn that an ordinary Mac printer cable (effectively a 'null modem' cable) would be all the hardware you would need. If you're in the U.S. Jameco sell a 1.8m (6ft) example (part 10604CP) for $4.95.

Rob> What software would be required (does it act like a
> network where you could see one's drives on the
> other's screen)

Someone else here may be able to point you in the direction of some appropriate software. The software probably doesn't care whether you use the (RS-422) LAN port or one of the other (RS-232) serial ports.

The LAN port and Serial 2 share a UART, so don't try using both at the same time. Avoid Serial 1 unless you know the software does not use hardware flow control.

Rob> 2) Are their any complications (they currently run at
> different speeds etc...), or was the lan port only
> for use with apple computers (I've heard it called
> apple talk)

Atari seem to have followed the Apple Macintosh serial port pinout. Some (not all) Mac serial ports can also serve as LocalTalk (formerly AppleTalk) network ports if you plug a LocalTalk adaptor in. I don't know of any software that could use that on an Atari even if the hardware were compatible.

I'm told that the LAN port works up to around 38.4k BpS, but the machine might get quite sluggish trying to service the serial port interrupts at that speed.

Hope this helps,
- Andy Ball

Hi Frederic,

>It is an indirect insult. aniplayer claims mp3 and divx, your answer;
>totally useless coz 80% of the people use atari stf 2meg anyway, oupdidoo!

Didier is old and wise enough... if he feels insulted I'm convinced he'll
let me know. I would say that 80% is a very conservative estimate, let's
agree on 88-90%...

>Once again, you mix hardware and software in a software/OS discussion.
>Nice way to shield your poor arguments.

I don't, but you just won't accept that these two are linked close together.
You can improve MiNT untill kingdom comes, without decent hardware showing
it off, it will always be what it is right now...
Oh and I know you're all hoping on Aranym/EmuTOS, and yes then it would be
possible to run MiNT on a powerfull platform, and then the door of open
source software will finally be wide open, but it all depends on the
hardware, and how many people are prepared to follow that particular route
ofcourse. If and when it happens, I expect fireworks in here :-)`

Cheers from Belgium

> if >= 16 col
> set icon=colors
> endif
>endif
>
>Do understand that?
>
>This is biased coding, but guess what, we'll never know and never be able
>to fix it as the code is not available.

Yep I understood you loud and clear...
Could you explain why Payrus displays that taskbar in colour when running on
a PC-emulator (not MagiC-PC) which emulates a humble ST? The only reason I can
think of is that Papyrus has a couple of lines in its code that look like
this:

set icon=color
if cookie = mint found
then:
fuck up display/taskbar
if >=16 col
set icon=monochrome
endif
endif

>Atari when releasing one of the latest AES released some example code (src
>and binary) on how to use toolbar, icons etc.
>They ALL worked on ALL OS, color or not. (magic, singletos (provided the
>AES was recent enough) and mint/naes).
>That is the standard that was set. Explain to me why Papyrus did not use
>the code that Atari released?

>Please give me a GOOD answer, do not ignore this one!.

Would you define "good" please? <grin>
But I'll give it a go anyway...

You've just commented on my totalitarian views about the need for everyone involved in and with computers to have at least a basic knowledge of English remember? Well what if I told you that all those example codes, sources and binaries were mumbo jumbo for most German programmers? IIRC it took almost 18 months before Atari Europe released the translations in German and French.
About papyrus:
ROM introduced Papyrus at the same show where Atari introduced its latest AES (Iwas there), and since the ROM programmers didn't have a crystal ball and they didn't understood English either I presume you can guess what happened.

BTW: you still haven't told us how long it takes to convert a standard audio-CD into glorious mp3.... playing mp3's is one thing, creating them another. No need to tell you that I also expect a "good" answer is there?

>naes fucks up, I like that. Read comments I made above.
>Naes does not fuck up anything.
>Papyrus author could have used the standard way to use toolbars with color
>icons with select and all. Why didn't he? Please explain.

It does fuck things up, the living proof is XaAES from Henk Robbers, with that AES installed... things all of a sudden look much better. Even the Papyrus taskbar is shown as the programmer intended it to. TempusWord Pro which uses the {userdef} underlines in the menubar (the only program I know of that does this) is even displayed correctly, so can you explain me why N.AES fucks the whole lot up but still according to you and some others here is perfect? Has Henk Robbers achieved the impossible? Or are the people behind N.AES not so capable after all?

And since you like it so much, I'll repeat it: Naes fucks up :-)

Cheers from Belgium

Hi Frederic,

>why isn't RPM working on magic?
>There's no reason it wouldn't.
>Unless Magic is lacking some OS calls.

I never tried it under MagiC, but then why would I?
There a no rpm packages available that will run under MagiC, so like I said I have no use for it. And since some people here obviously find it difficult to grasp "I don't need it", let me explain it in plain english:

I don't smoke, I don't need an ashtray.

>Would be pretty nice to have a standard packager for atari (all OS).

AFAIK we have one; it's called LZH, some people prefer using ZIP though. And yes I know that you have something different in mind... but since it needs to run on all the OS's, RPM is out...

>>I believe strongly that English should be the universal computer language,
>>non native English speaking people, who wanna work with a computer should
>>make the effort to grasp at least the basics of the language...
>
>wow, that's pretty a totalitarian view there.
>You are saying you should have at least the basics of the language, yet
>you don't want to learn the simplest tool made available to you by some
>enthusiasts for free. Here you want people to learn another language.
>You are so weird Dennis. How about you learning C?

There's nothing totalitarian about it, it's just simple common sense. And it would make life a lot easier also. Internet for example pretends to bring the world together. It does, as long as all the parties involved talk the same lingo. Take this group for example, suppose we would all start writing in our native lingo... it wouldn't take long before everyone would plead to return to plain English. I speak Flemish, you speak English, Janez speak Swedish and Adam Polish.... it wouldn't be much of a discussion would it?

Have you ever seen the programmers docs from MagiC and some of its sources? That's another reason to advocate the use of English. And why would I need to learn C? C is not a language, it's a tool for programmers who don't want to learn assembler. I'm not a programmer, so I don't need to learn anything about their tools either. A language is something which people speak, have you ever heard someone talking in Basic, C or Fortran? I never did :-/

Hi Zothen

>I`m thinking of a PowerPC G3/G4 based ST.

Get in touch *privately* with Jared Falvo, he's thinking of building the
same thing, but whatever you do, don't mention "Steve Sweet".
mailto:luposian@lycos.com

>Is there such a system and a modern TOS version ?

No the best so far is a 68060 based machine, do a search on Google for the
words "MiNT" and "MagiC" to see how TOS has evolved :-)
While you're at it do a search for "Aranym" and "EmuTOS" also, both are
still in beta phase but quite promising.

>But the biggest problem may be that such a system would be too
>expensive because the market is too small and a $300 PC can emulate
>any ST - but does not have the STs MIDI ports etc.

There's an ISA card available with MIDI ports for the Milan and probably the
Hades also.

Hi Frederic,

>What you are definitely NOT understanding is that:
>
>1) your examples are very poor because you are trying to run magic/ash
>apps in another OS. As in, has ANY MiNT user complained that rpm wouldn't
>work in magic? This is as dumb.

I know it was a long posting, so you've probably skipped some lines. If you would have read it carefully you would have noticed that all the examples given run under both ***TOS*** and MagiC. The only ASH apps I know that are MagiC only are: the iconnect clients. Everything else they've ever released runs just fine under SingleTOS 1.04 and higher.

>2) you are showing that those magic/ash application are not clean, and
>when one app (calamus) cleaned it own code, you claim that this is not
>good coz you don't want to upgrade.

I've shown that all these apps run perfectly under TOS and MagiC. Can you explain me why unclean apps work perfect under TOS but not under MiNT which is touted to be 100% compatible?
Why would I update my Calamus which runs *perfect* under both TOS and MagiC? One has to do more then just update Calamus, there are also a lot of modules which need to be upgraded, all in all that costs a small fortune.
Why should I spend all that money, just to get it running under MiNT? That "unclean" app runs even perfect under TOS. It seems to me that there's something not very clean in either MiNT or N.AES that needs to be cleaned...

>Magic has changed the behavior of some of its API, why? no apparent
>reason, this split the OS market, and we come to this, texel not working
>right with any OS other than magic. If you answer that it's because magic
>is superior, you are a moron.

Sorry Fredric, you've lost me.... I've no idea what your on about, but I can tell you that Texel works great under TOS also...
What the hell is going on here? You're the third person who don't wanna know or hear that all the mentioned apps run and behave correctly under TOS. It's not my fault that for whatever reason MiNT/N.AES fucks up. All I can answer is that TOS and MagiC seem to be superior in that respect.
If it's any consolation, I don't think for one minute MiNT fucks it up, it's that crappy N.AES who's to blame...

>4) Many people respect the original Atari spirit which was broken years
>ago by magic, that pisses me off and find ourself in the midst of this

>big giant mess.

I've wrote a rather long post replying to Lonny about this. It all depends where one is located... Atari Germany (European HQ) used to push MagiC, they were probably to embaressed with MulTiTOS. So as far as I am concerned MagiC respects the original Atari spirit also. And considering that Europe was Atari their only real homemarket, one could even go a step further and say that MagiC is the real Atari multitasking OS. Even KAOS TOS (the predecessor of MagiC) was treated as though it came from Atari itself. Official Atari dealers were allowed to sell it and even replace TOS with KAOS ROM's. And this was way back before anyone ever heard about MiNT...

>Your examples are ridiculous, I could create a better example story about
>a mint/naes user trying to go to magic, and guess what, MORE things would
>be lost, we are not talking about the icon not showing quite correctly, we
>are talking about crashing the system, or not running at all, because
>magic has to trim down its code or it won't fit on a floppy anymore, nor
>run on 1meg ST.

You can call my examples anything you like. Fact is that I choose them very carefully. The chosen apps are used by a multitude of people, even here in CSAST a lot of people use these apps. I've told you before that I'm not really interested in what OS is running on the computer. As far as I am concerned a OS should be running in the background doing its thing and let the user gets on with whatever it is he wanna do. If there's one thing I do not want to be bothered with when sitting behind the computer it's the OS. All I wanna do is run my apps, for some reason or another the mentioned "ridiculous" examples run just perfect under both MagiC and TOS, but are being fucked up under MiNT/N.AES.... as long as this happens you won't see me and a lot of other people switch. Because it's the apps that are important to me and those people, not the OS.

>See, if magic (as buggy as it is) was to respect the APIs already in place
>and follow a more standard way of doing things, then it would be awesome,
>and I would have NO problem at all with magic, really.

AFAIK the very first MagiC API was released in 1989, long before the mother company (the morons in Sunnyvale) released *their* specs and standards. All the major softwarehouses and developers in those days followed the MagiX standard (it was the only one available). One could even say that the standard was already set but that like usual Atari Sunnyvale had no clue, and screwed it up.

>The difference is that Magic can't claim ignorance as a simple look at the
>code to mint's internal, and bam, same features.

Once again.... are you receiving me?
There was no mint code to look at, mint only existed in Eric his head. MagiC is the follow up from KAOS TOS, that one was released back in 1986... I'm sorry that it never reached your part of the woods, if it would have. Then surely Eric would have had a good look at the MagiX's internal, and bam, same features.

>MagiC is 100% great as they say and all their software run great and they
>don't need any other tools as they are either useless, or have a better
>magic/GEM replacement. So everything's great, right?
>Please leave the "more" experienced user play with MiNT, Unix and more
>recent hardware, just don't expect anything from it I guess, as magic is
>clearly a different market all in all, as Dennis so elegantly
>demonstrated.

I'm glad that after all these years of discussions you finally saw the
light, if all the other MiNT'ers from now on follow the same thinking
pattern then this should be the last thread MagiC <=> MiNT. MagiC users are
old and wise enough to decide for themself, they happen to work with a
particular OS and obviously like it... they're perfectly capable of deciding
for themself what's best for them.... they don't need assistance from an
helpfull MiNT'er.

Cheers from Belgium
Dennis

> (I don't know what other filesystems MiNT now supports)
> partitions are handled?

Yes, it basically works this way. There must be at least one normal TOS partition to boot from. The filesystems on the other partitions can be of any type.

>
> I would be interested in learning how the Atari boot
> procedure works. I think the PC loads a master boot record

There should be loads of information about it in the internet and it has been described numerous times in Atari-related books. It is basically the same as with a PC.

> Does an Atari hard disk driver include a boot program that

The driver is loaded by TOS and then executed. When it has initialized TOS continues with the boot process.

> You mentioned that the 256 Mb ceiling was imposed by a
> (19-bit?) sector count limit. Is the 512 Mb ceiling similar
> or is it geometry related like PC IDE's old 528 / 504* Mb

The TOS limits have nothing to do with the drive type or geometry. TOS and the FAT file system simply have internal limits wrt sector sizes and the maximun number of sectors.

Are you running ST programs? Apparently those dont run well on a Falcon030.
Does the same here. Especially games.

Tim

Absolutely. The previous owner of this machine used it mostly for Cubase
with an external SCSI drive.

Yep. It also supports Ext2 (which was the standard for Linux until Ext3 came up.. no driver for MiNT for Ext3 yet I think) :) and I believe there are also experimental drivers for AmigaDos and even Mac HFS IIRC. It's a long time ago I heard about those though, and I never saw a use for them so I have no idea if that ever got any further. :)

Also NFS (network drives) and the ramdisk work that way.

Actually, other than in most other unices, MiNT doesn't really have a "mount" principle. Any drive that is recognised by a driver, gets a directory in drive U: (and in most cases, also its own drive letter, although not NFS for example). The "mount" into the root filesystem is not much more than a symlink to the drive folder in U:.

On a side note, as soon as (or: IF) I find the appropriate documentation for it, I'm going to try to write a MiNT driver to see the Siemens S55 (and probably other mobiles as well) as a drive. Interesting experiment. :)

Maurits.

> power of Mint, with the visual "wow" factor of Magic.

That's what I've been saying ever since I knew Magic and MiNT. :) Magic has a superior AES but the rest of the operating system sucks. The reason Magic "feels" fast is that the AES is 100% assembly. As long as a gem application is busy drawing stuff, this means Magic IS faster (which leads some people to believe Magic is always faster, even when playing an mp3 or other stuff like that which, as has been rightfully pointed out, has nothing to do with the os).

Anyway, Magic would make a fine AES for MiNT, that is if it wouldn't have violated AES 4.1 specifications (unfortunately that's slightly more difficult to resolve than just not implementing them).

But anything is possible I guess. When ASH sees no more commercial value in Magic, they MIGHT release it (which to some people here would mean it's dead but would actually give it new life), it could become a MiNT AES and it would end all discussions. :)

That is, once we explain to people that sticking MINT.PRG in the autofolder is enough to use MiNT and you don't NEED 10mb of unix software. :)

Maurits.

> give MiNT a try because it has more functionality,

I should mention here that all Magic <-> MiNT flamewars I've seen so
far, start with Magic users telling MiNT users that they're using weird
freaky software (in several different wordings, obviously). This makes
the MiNT people jump to the defense that this "feaky" stuff gives the
power that every other computer platform (even Windoze) has accepted as
the only way to go (Unix API). So your story is already irrelivant to
the discussion.

> them and brace yourself. As someone who always used MagiC, from what you've

This actually describes me perfectly, when I changed from Magic to MiNT.
It was my first Unix experience what so ever, and it gave me a jumpstart
at all other Unices (Linux, Solaris) for which I'm very greatful. It has
given me a great advance in my job career (my school didn't give a sh*t
about unix).

> that you need an additional desktop and AES to get it running... The first

On the other hand, I can walk over to MyCom and buy a copy of Magic
rightaway. I see your point. Silly me. :)

> It's not exactly cheap either for what

Really? Hmm I must have missed that. Or I'm super intelligent. I guess.
As far as there were learning curves (there were, for setting up stuff

like a mailserver and other things the atarian you descibe wouldn't
probably need), the things I learned appeared to be very handy knowledge
in the real computer world, at first to my surprise (now I'm used to it).

> you can even use STiNG/STiK clients if you prefer to do so... after a very
> short time you realise that your iconnect clients aren't all that bad as
> some would like you to believe...

Why is this exactly? In your little story I am missing the point why
MiNTnet is so unusable. The configuration parameters are the same. Oooh
I see, you have to enter them in a text-based setup program that asks
you for the parameters, instead of a 3D dialog. Silly me.

> You've anticipated a couple of problems while switching to MiNT, but
> nothing like this... your trusty reliable stable Calamus SL95, keeps
> crashing.

I can't speak for Calamus SL95, but 2000 works like a charm in n.aes. Oh
yes of course it's yet another version to buy. Well when I was still a
Magic user, I had Calamus S2.0 and I really had to boot to singletos to
make it usable.

> You've been told that your Calamus is outdated and you need to
> update it.

Try run an older version under Magic :)

> When you ask why it doesn't run correctly under MiNT all of a
> sudden, you're being told it's a dirty hack...

Calamus was completely multitasking-unfriendly at first, and then slowly
made better through the years (and versions). Maybe it was usable in
Magic before it was in n.aes (I'll take your word for it, can't speak
out of experience), but the current version works in both. So that's
irrelevant.

Funny to see how you advocate old software versions (waste of money to
buy new ones) when it's convenient, but talk about lack of new
developments whenever that suits you. :)

> Atari is a hobby for you,
> and you have a family to support.... and the budget is in the red this
> month, you really can't afford to spend 200 EUR updating it,

149 euros if you update to SL2003. And SL2000 is probably for sale for
less if you find it (left-overs at dealers, or second hand).

> so you reboot
> the computer and boot Calamus in MagiC.

FATAHLER FEHLER :) That's what happened last time I ran Calamus in
Magic. Since then, both have been improved so now it works. But, as you
say, not worth the money is it.

> DO I HAVE TO GO ON???????
> I can give you at least another hundred examples of how the combination
> MiNT/NAES fucks up....

Likewise. :) But just read through this thread and the hundreds of
others before this. Your little rant about n.aes-incompatible software
really doesn't make a point because the problems the other way around
are the same. In addition to that, the Magic incompatibilities are
caused by Magic violating existing AES specifications (and programmers
following that).

> MagiC users are being told that MiNT is 100%
> compatible with TOS,

It isn't, and I never saw anyone say that. On the other hand, Magic
certainly isn't either. It's actually worse (because of the above
mentioned specs), but a lot of programmers followed Magic's wrongly
re-invented wheels. Until recently that is, but you "sweep that point
under the table" by saying people shouldn't upgrade their software.

Nice :)

> other priorities. Switching from one OS to another should give one at least
> certain advantages, in this particular case there are no advantages. The
> GEM apps won't run any better then they did before, in the worst scenario
> some won't run at all or severely hampered... And even if one takes in
> account that MiNT is capable of running ported open source apps, then he
> should be told not to expect the present day applications running, not
> because MiNT can't handle it but because of the hardware that can't
> cope....

The above is really the reason I'm getting tired of this pointless
stuff. Why do you think I'm running MiNT? Do you think I need YOU to
tell me that it's functionality is useless? And what's this hardware
thing everybody is shouting about. I've been using MiNT since my Mega
STe days, and was perfectly happy with it. It also ran happily on my
unaccelerated Falcon for a long time until I got a CT2. I never saw the
problem.

Why don't you just face it that it has more functionality that YOU don't
need apparantly, but OTHERS DO so stop telling them what to like and
what not to like, what to find useful and what not to find useful. Maybe
then you'll make enemies less often.

> Oh... I have a USB based DSL connection here, now if any of the MiNT power
> users could explain me how on earth I get this thing attached to my Atari
> TT or Milan060 without the need of networking it to a Mac, they might just
> convince me to start using MiNT.... at least for internet use. Are there
> (ported) DSL drivers available for MiNTNet?

There are DSL modems that speak plain ethernet, so that would work in
MiNT and even in Magic.

Anyway, it's probably not that difficult to port pptp (which is what most dsl modems use) to MiNT. I think someone is already working on it. But hey, you don't want ported open-source software. So I guess it's not for you.

By the way, when is the iConnect driver for DSL coming?

> Well Maurits, I've at least tried to be objective.

No, you tried to display a selective list of facts that can be twisted into your direction.

> a doubt I'll be accused by some here of lying, being biased,

LOL!!!

> the MiNT users and people developing software for it etc.. so yes I agree
> that an in-depth discussion is impossible.

Yes, your post is a perfect example that shows why it is. :)

Maurits.

Magic won't be much of a success either. He should stick to singletos.

Wow, you've just proven my point!! Stop telling me that my setup sucks.
That's basically all Joe and me are saying. Even if Joe uses Singletos
and I use MiNT. :)

> need something very simple.... and that's what ASH supplied years on end,
> easy to install apps.

The hell they did. Both MiNT and Magic can be installed without any
computer knowledge when there are no unexpected problems. But there
always are. Don't try to convince me that with Magic there aren't, I've
worked with it.

Maurits.

> already, they are MagiC users now, not power users, but at least they can
> tap a little bit more out their computer now...

Your definition of power users is when they use fancy GUI thingies. My
(and other unix freaks) definition of power users is then they have
fancy Unix thingies. It really just depends on what your fetish is.

> there's absolutely no way
> I could convert one single user back if I should put a MiNT setup on his
> machine...

There's no way you're going to convert anyone to MiNT because you're
biased. Anyone who hears your side would hate it.

> in time they may learn about MiNT and decide to try it out,
> but it will take a lot of patience and a lot of time...

Like I said, you're biased. :)

> time which we
> unfortunately haven't got anymore. So, it's essential to keep this
> platform going that new software can run at least under MagiC and if
> possible also under TOS.

Yes, let's all point our developments to the platform that has is
abandoned by its developers and has no way of porting other things (like
the DSL driver you want), so that the few programmers left will have to
rewrite anything from scratch and have no hope of an OS update ever coming.

> If only to make sure that all the Joe's remain
> here, we need them to be a platform... no one in the real world will take
> a (devided) group with a couple of hundred people seriously...

Aha, so this is where your brainwashing efforts are coming from. Well
from what I see, the only reason we still have the people we have, is
because there is something for everyone (GUI-addicts, Unix freaks,
Spartanic TOS gamers). And (outside this newsgroup and some
mailinglists), *respect for their choices*.

I would advise you to let Joe continue to use Singletos, and me to use
MiNT. Convert us to Magic and Joe will switch to a playstation and me to
Linux. (Well, I'm already using Linux, and OS-X, but they still work
happily together with my Ataris). :)

Maurits.

Hi Lonny,

>> Actually Dennis, care to explain what they have been missing out on?
>
>I missed out on the file loss and partition corruption some of my friends
>experienced.

Personally I have never experienced anything like this and I don't know any other MagiC user either who experienced it. I'm not saying your friends are lying, but when such an unfortunate accident happens one tends to blame *something* for it.
Has it ever crossed your mind that the file loss/corrupt partition(s) could be caused by something completely different? None of these people happened to be using the Newsie crap at the time that they've expirienced the crash? That program is notorious for fucking up files and FAT's, especially when writing log files is activated... whenever I heard of someone having such misfortune, then there were always two constants in play: it happened under SingleTOS and the hard diskdriver was AHDI.

If you ask me, someone loosing files or facing corrupt partitions usually only has to blame himself for it. People who experienced this usally had only recently before attached/removed another hard disk, scanner, cd-r or whatever to the computer. If the termination of only one device isn't set correctly, you can bet anything you've got that the boot partition FAT will get corrupted. It might take some time before the user notices it, but it will happen... one should always after attaching/removing a device, reboot, save the desktop and immediately afterwards run a diagnostic test of *all* the partitions. If the test gives green light, then one knows at least that his whole setup is terminated correctly, when the diagnostic tool however gives an error, then in the worst case only the desktop info file will be corrupt and lost... but at least the FAT will be repaired before any fatal damage occured. That's the theory behind the story, in practice however no one actually does this little test, and to stay on topic, it doesn't matter what OS is used, they're all affected by it. It's not an OS issue, it's a human factor issue.

Cheers from Belgium
Dennis

I'm planning on doing a "final" release of Taskbar, which will include
full sources. But before that I'd like to fix it up a bit, so if anyone
here's still using it and has problems of any sort, please send me a mail
with a short description of the problem(s). I'd also like a short
description of the system it's running on (OS, memory, desktop, NVDI
etc). I'm especially interested in hearing from MagiC-users, as I now
finally have a decent MagiC-setup to test it on.

Maurits van de Kamp a ï¿½crit le 28/07/03 12:34:

> Magic has a superior AES but the rest of the operating system sucks.

I agree !!

Why don't make a open letter to MagiC's author for ask him to release a commercial AES for Mint like NAES? (If we wait for a GPL one from ASH, we dream)

I'm sure that many people (me the first!!) will buy it... It's a great commercial opportunity for ASH because now, the "MagiC's business" is closed.

I know, the MagiC's AES isn't "4.1 compliant" but personally, I don't care... I'd use compatible stuff and porting Tos2Win on it will be easy.

Regards
Zorro

Well I already know that most ST programs have problems with that.
I mean, Falcon Specific games and programs , only a handful seem to
run right.

Now reading through some other articles it appears that NVDI was
required for some programs?

What kind of setup do you have Tim? And are there any specific art
programs you can
recommend for the Falcon? as far as the Falcon games... I should be
able to run ALL Falcon specific games (as I have friggin 14MB ram) but
I think I'm just missing some file handlers? (I think that's what it's
talking about?)

I try to read a text file and all it gives me is a friggin picture of
a B&W eyeball? Hmmm

I've never had to set my falcon up from scratch before, but I'm
learning now! ;)

Clint

When you say you're running them in "straight TOS", is this a clean
system (i.e. holding down Control while booting, or having no AUTO
programs, ACC's, or CPX's)?

One person has already mentioned that if the software you are trying
to run is ST software, that may be your problem. However, since you
mentioned that this software runs on other Falcons you've tried, that
shouldn't be the case. If you are trying to run ST software, try
getting Backward 3. It allows a lot more older software to run quite
happily.

> Chu Chu Rockets and Super Fly seem to only work in MiNT so I have to
> run that slow@ssmolasses program. I can't get NVDI 5 installed right
> and NVDI 3 I have is zipped and does NOT want to
> unzip for anything :(

Any of R.G.'s software should run perfectly fine on a clean TOS
system. They do on my Falcon.

> I can't read german, that's a problem!

Yes, for me, too. I've taken some German courses, so I can figure it
out if I have the time, but usually I don't.

> Then, there's some files I copied from my CD to the HD of the falcon,
> these files will not go away at all!!! I can't delete them? Illegal
> Function or if I drag to the trashcan it doesn't do anything, what
> gives?

Have you checked whether or not the file is set to "read-only"? That
will often have that effect. Or, possibly some hard drive problem?

> Should an FPU help much at all? Maybe most programs require it?

Most programs *don't* require an FPU, actually. Only a handful do, and for those programs, it really speeds things up. But most software will run fine without it.

> MagiC 5 or 6? which one should I go with? Can I get them in English?
> (I dont want to mess with anything German, no good if I can't read
> it!)

I would go with version 6. You can get it in English at the Atari Workshop store in England, I've heard, or there are a number or second-hand copies floating around from time to time (that's how I got my copy).

> Also, will running Magic allow me to run all the atari programs that
> SHOULD run normally anyways but doens't?

If it doesn't run in TOS, and isn't Magic-specific (like Stewart), then it won't run in Magic, either. However, it similarly shouldn't run in Mint if it doesn't run in TOS, and you've mentioned that the above software does. Perhaps your TOS ROM is bad? Have you checked to see if the ROM is seated well into the socket? I know some ST's had this problem.

Anyway, hope this info helps you!

5053. Milan hardware problem...

Newsgroup: comp.sys.atari.st
Date: 2003-07-28 19:28:58 UTC
From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <bg3thq$j9t$1@tyfon.itea.ntnu.no>
Source record: 25026

So I fired up the Milan today for the first time in a month or so. It wouldn't boot. It didn't respond to the keyboard during the RAM-check, and when the RAM-check was finished and it was supposed to boot TOS, I only got a white screen.

I checked my connections, SIMMs etc. and tried again. Didn't help. The I noticed that the LED on the receiver for my wireless mouse didn't flash when I moved the mouse. I know that my Milan won't boot without a mouse attached, so I figured that the receiver was broken. Connected a known working mouse, and now it booted! However, only the mouse buttons works, not the mouse itself. The wireless mouse works fine on my PC. Does anyone have a clue what's going on here??

If it a non-commercial game you can upload it to the Belgian ftp-server.
For the right address see my signature.
Uploading is only possible in the incoming dir. If you do so please
provide a small description file (.upl) so that I know what exactly the
program does.

CU,
Martin

Whats wrong with the word HACKS anyway?

Its only kneejerk political correctness cretins who read the wrong thing
when the word is written. The original use of the word is intended here.

Smeg.

5064. Megafile Drives Error

Newsgroup: comp.sys.atari.st

From: jon
Message-ID: <w%kVa.21792$Je.18893@fed1read04>
Source record: 25037

Since this group has always come through with all my other posts, I thought I would try yet another.

One of my systems, a Mega 4, TOS 1.4, ICD AdSpeed 16 with 3 Megafile drives is giving me weird errors. Each drive's main partition has a "Fat Copies Don't Match" error as reported in MichTron's disk utilities. It causes the main drive to not autoboot intermittently. I have tried to load every flavor of disk boot software imaginable (ICD, Supra, Atari, etc) and the only one that works is the Atari driver. The others lock up after the format/partition. I have not tried Uwe's yet, but, if that will fix it, I will order right away. I found out Best carries it in the US.

This is driving me nuts..... I can't put my finger on it..

I have all the drives identified as: Device 0,1,2 respectively. The chain is correct, the cable length is under 10 feet total.

Individually, they boot without any errors. It's only when they are chained.

Any ideas?

Tony Cianfaglione <ab616@chebucto.ns.ca> wrote:

> What do you need to connect a Falcon and an Iomega zip drive?

HDDriver. Older AHDI releases do not accept SCSI IDs like, 0,1,6
so you have to use it in line: 0,1,2,.. as example.

Zip drive can only set to ID 5 or 6 if iï¿½m not wrong.

Last point, a lot of Zip devices do not terminate SCSI bus well.

Other points to look at:

Some software will not run from a CD.
Some must run from a hard drive or booted from a floppy.

The following is pur speculation on my part:
I've had problems with certain games due to the hard drive driver (or it seems to be that problem) maby due to my old hard drive being accessed by a faster driver (as HDDRIVER) and the old hard drive can't handle the faster access speed with certain programs.

Hope some of that helps,

That's quite normal for an SM124 or any other Atari monitor. You could slightly expand the picture using some adjusting controls in the monitor. I did that to a couple of SM124s but it requires you to actually open up the monitor.

Does it work when you disconnect the keyboard?

This sounds like a mouse/kbd power problem. Check the +5V on the KBD/mouse
connector when both are plugged in - if it is less than ~4.8V, the trace on
the PCB that supplies the power is probably gone, due to an overload / short
circuit. Mouse and KBD can still "sort of" work because they get some power
via the data lines.

If this is the problem, then it can be fixed with a short piece of wire that
needs to be soldered to the bottom side of the PCB - inquire for details.

While the ST has games that require 1024kb of memory, the
PC will soon have games requiring 1024mb of memory ;-)

Ahh, the sweet smell of progress. Smells like boiled cabbage.

No, although I really can't tell as the Milan will not boot without both
mouse and keyboard connected. I can unplug one or both after it has
booted, but that doesn't make any difference.

> This sounds like a mouse/kbd power problem. Check the +5V on the KBD/mouse
> connector when both are plugged in - if it is less than ~4.8V, the trace on

Hmm... Since this happened after I connected the wireless mouse (and I've
barely used the Milan since), could it be that the receiver overloaded the
power line? I'd assume that something like this sucks more power than a
simple mouse.

> circuit. Mouse and KBD can still "sort of" work because they get some power
> via the data lines.

Sounds reasonable. I just tried with another keyboard (the one I used
previously on the Milan before buying the current one), and it didn't work
at all.

> If this is the problem, then it can be fixed with a short piece of wire that
> needs to be soldered to the bottom side of the PCB - inquire for details.

I'll check the voltages and get right back to you! If I indeed have bad
power to the keyboard/mouse-port, could I just take +5V from somewhere
else and feed it directly to the ports? I'd really like to continue using
the wireless mouse. If you've ever seen my desk you'll understand why ;-)

Hi,
for the users who will fit their CT60 with solders.
If you use the boost option (F030 Bus at 25 MHz), for the moment,
there is no software at boot to recognize a RGB/Mono monitor !
You can DAMAGE your monitor because a 32Khz signal will be send
instead of 15.625 KHz.

Be patience please :)

As I said, I couldn't wait, so I dug out the schematics for the Super I/O
and did some measuring with my multimeter. Turns out there's no power on
either the keyboard- or mouse-connectors Vcc-pins. So I just soldered a
2cm wire from the Vcc pin of the resistor array between the connectors to
the Vcc pin of the keyboard connector. And now no more "keyboard not
found" at boot up, which I've aways believed was a bug since it's been
like this ever since I got the Milan! The mouse also works perfectly.

Zip or lzh can't install or uninstall a software package. It can't keep
track of updates and notify you automatically. It can't warn you if you
try to install a program that depends on another package, and that package
isn't installed or up to date. rpm can do this.

I believe it should be possible to adapt rpm to work with a simple
TOS/MagiC/MiNT-setup, and if you used a GEM frontend (they exist) it would
be a very powerfull tool.

I can explain it: No TOS that runs on a ST support colour icons. So
Papyrus must use some custom code to display them. This code doesn't work
properly under N.AES. N.AES doesn't "fuck up" in any way - the coder just
hasn't tested his program thoroughly enough under N.AES (or perhaps he's
satisfied with the current behaviour). The obvious solution would be to
simplify the code and bypass the custom code whenever running under an AES
capable of displaying colour icons. I volunteer to do this, if someone can
give me the sources...

>
>I tried programs in MiNT and then just in straight TOS.

Hi Clint!

GEMDOS error #-35 is too many files open (no more handles left)

At first I guessed you might have a faulty MiNT installation. But as this happens in TOS as well, do you have anything running from the AUTO folder, and/or any ACCs CPXs running? If so, disable them all (by renaming them from the desktop to PRX, ACX and CPZ respectively) and try again. If progs then run, reinstate them one by one until you find he culprit.

The other pssibility is that perhaps a previous crash has left some files open on your hard drive?

You can also hold down the [Control] key (or is it [Shift] or [Alternate]? - it may depend on your hard disk driver) during booting to bypass the hard drive altogether, then see if you can run the programs from floppy. If so, the problem is on the hard drive.

Note that many games will *only* run from floppy, and that some ST games won't work properly on the Falcon. There is a Backward 3 AUTO program that allows some of these to run.

>I can't read german, that's a problem!

If you send me a copy of the messages, I can translate them for you.

>Then, there's some files I copied from my CD to the HD of the falcon,
>these files will not go away at all!!! I can't delete them? Illegal
>Function or if I drag to the trashcan it doesn't do anything, what
>gives?

Many CD files are 'Read only', so write-protected which cannot be deleted either. Try looking with 'Show Info' from your desktop. If you remove the 'Read only' flag, you should be able to delete them. (The wording is with Thing desktop - it's a litle different with the native Atari desktop, where you can swich to 'Read/Write').

>Should an FPU help much at all? Maybe most programs require it?

No, *very* few programs make use of the FPU - some raytracing programs are the main class, though there are others.

>I already have NVDI, but I can't get it installed? What can I do?

If worse come to the worst, you might have to copy off to floppies or your CD writer all the files you want to keep that you do not have on floppy already (provided you can manage that) and then re-partition or even reformat the hard drive.

>MagiC 5 or 6? which one should I go with? Can I get them in English?
>(I dont want to mess with anything German, no good if I can't read
>it!)

The latest MagiC 6.20 is available from Atari Workshop in Bracknell, UK - see www.atari-workshop.co.uk or email info@aari-worshop.co.uk

>Also, will running Magic allow me to run all the atari programs that
>SHOULD run normally anyways but doens't?

There are some programs that *require* MagiC, but not many. Mainly those that you want to multitask with. Most should also run with MiNT, though some may look a little peculiar, as has been discussed in this conference recently.

I've read that it's possible to increase the size to fill the screen but
that doing so puts a severe strain on certain chips in the monitor.

Probably not so. I have fixed a few of them, and what goes, first, is a capacitor put in the wrong place from an engineering viewpoint. You cannot change the horizontal frequency, since the windings on the tube neck and that capacitor control that.

You cannot change the vertical frequency, since that is an incoming signal. You cannot change the z-axis, because that is an incoming signal.

What you adjust, as I dimly recall, is the magnets on the neck of the tube. That has been done so many times that there is probably a FAQ on that. At least, that is one of the things you have to adjust.

That is to recenter the trace after, I think, adjusting one potentiomenter and one coil, to adjust vertical size and horizontal size. The board is marked. The magnets are not.

The reason for the blank edge is linearity. Some people used those things for serious work, and NCR used that basic design as a bank machine monitor. If you stretch the picture, you lose linearity. That being said, I stretched the picture on several, but I do not use them for drafting any more, having a TT with a big monochrome monitor, with black edges to preserve linearity.

Jim

I got mine today! No clue what number I was, but I think I paid real early. And, why would you feel old? I have only been around the Atari since the Atari 800, and the ST at its birth! :)

Its installed (I JUST got it going). Even though I have not played around with it, I must say, I *AM* impressed. EASY to install (Well, taking apart the Falcon is never fun, but that is not Rodolphe's fault), and it works (except for an AUTO program I had setup, still working on that though). The DiMM I got works too, over 128 Megs of RAM, never thought I would see that on any ST!

Excellent construction as well. The wait has been worth it!

My current installation is this:

Original Atari Falcon case with a MicroATX Power Supply, and a Reset Button stolen from an old PC case for the Power Button, 128 Meg DiMM, 16 Megs of RAM, and a ScreenBlaster.

I plan on either towering the Falcon, or just buying a different ATX PSU, and construct a little board with the various ATX/CT60 functions.

Once I get some time to dive in and play more, I will post more.

Am I the first stateside to get it????

Keith

There are two ways to expand the picture. There are screws inside that allow you to adjust vertical and horizontal size separately. If I remember correctly (!!!) they are harmless, but it's a bit difficult to get the proportions exactly right once you start screwing :) with them. (If you have a circle on the screen, you want it to be a circle, not an ellipse).

There is also another screw that turns up the voltage to the control circuit. This will make the whole screen proportionally larger, which is easier, but this will eventually fry your sm124 (beyond repair). The idea to enlarge your screen this way was once published in a Dutch Atari magazine. A few weeks later, Atari Nederland was flooded with broken SM124s.

So be careful :)

In answer to your original question; the picture is actually "supposed" to be like that, your monitor is not broken.

Maurits.

I still use it. :-)
Currently I use it under Mint1.16alpha/N.AES2.0/XaAES0.970/Thing1.29/NVDI5.03
on my Hades060 with 128MB memory.
Under XaAES is still the problem that we cannot switch with Taskbar
from one application to the other. The start button runs fine.

Some times ago you send me an update of taskbar which solves the problem
of displaying the taskbar buttons under XaAES if I remember correctly.

For a Falcon you don't need a Link - that's for the ST range and converts
Atari's version of SCSI to a more understandable version.

As has been said, the Zip can be set to ID 5 or 6 only, and it has its own
termination via a small switch on the back.

Make sure that you've connected your Falcon to the correct port on the drive
(the one marked "Zip") and try an external temination block if it's the last
thing in your chain) with the termination switch set to "off".

Hallo Dennis!

DV>I never tried it under MagiC, but then why would I? There a no rpm
DV>packages available that will run under MagiC

There aren't? I doubt that. I've got both MagiC and MiNT installed here, and
thus can install RPMs under MiNT.
There are programs available, that do run (and are useful) under MagiC, but are
available only in RPM form.

Examples:
- wget (command line http and ftp download utility). Works great with MagiCNet,
but has some small display problem (cr/lf vs. cr only).
- dosfsck (FAT16/FAT32 directory/file structure test and repair program). The
only available for TOS systems!

In order to get these programs, they should be made available as lzh, zip, gz
or other commonly used archive format. But as this would have to be done for
every single program, it would be a more convenient way to have the standard
RPM format available on MagiC (and perhaps even TOS), too. And should it be
solely for depacking, the package management routines would be less important
in this case.

rustynutt <rustynutt@hotmail.com> wrote:
: Did you leave the DMA buffer mod in place (if you had one installed to
: begin with)? I have two machines to try it out on, both have Nemisis
: installed. My Afterburner utilizes a slightly different DMA mod than
: the Mighty Sonic does. Something was brought up a few weeks ago here
: where Rodolphe found a timing bug in the COMBEL chip that might
: elimate the need for a DMA "patch", but never really came back and
: said for sure that was the problem. I hate to remove it and then have
: to reinstall, that's always been a black art of getting one to work
: just right.

To be honest, I am not sure what fixes this Falcon has had to it. I got it from a developer, and he said it had a timing and SCSI fix. It was only a 4 Meg machine, so I added a Wiztronics board + simm to it that was in the Toad stock I got, and also added a FPU. Also updated it to 4.04, it had 4.01

It has really never given me problems, and other than some SCSI issues under Linux, SCSI was always fine under TOS.

: I've looked around for a MicroATX Power Supply, but haven't been
: really sure what i'm looking at. Do you have a vendor site address and
: p/n for the one your using? On second thought, the Falcon Rack uses a
: full size powersupply, guess I could just purchase something to
: replace that, i've never been fond of using the standard case with
: either of the other cards, too many soldered wires running across the
: board:)

As far as a Power Supply, your best bet is to goto one of those Computer Shows for PCs (if you have them where you are, they are more like Flea Markets, and sell mostly PC parts, but some systems) and just look at the various supplies they have and pick the one you want. The supply I am using right now came out of an E Machine which went in for repair. It is very small, but the fan on it does not work (Power is fine, but they let me take it home, and put a new supply in it, under warrenty), so I was just using it to get everything going.

The only problem I have run into (not really a problem though) is that the ScreenBlaster resolution selection screen does not appear when the machine boots, but it still does switch into the approx 800x600 resolution, so that is not a big deal. I did try the game Running briefly, but it crashed.

Hopefully time will be on my side tonight, and I can mess with it more.

Now I just need to try to install Mint on it.....

Keith

i am in need of the following types of images for this website:

screenshots of games & applications (both in 320*200 & 640*480 JPG
format)
boot screens the classic systems (both in 320*200 & 640*480 JPG
format)
boxshots & catalog pages (both in 320*200 & 640*480 JPG format)
images of the classic computers themselves on a plain jane vanilla
bkgrnd (both in 320*200 & 640*480 JPG format)

...and other "appropriate" images are welcome!

email your contributions here: images@rtdos.com

For video resolutions, there is a nice software from Didier Mequignon on its web site !
And it works with CT60 sure !

Centscreen is running too fine (I use 640*480*TC with 25 MHz bus, like CT2 !) BUT centvidel (to create or modify a resolution) don't run on CT60 because of the speed CPU test on 030 that is different on 060.

Thanks for the advice....

holding Control and Shift on bootup allows the HD driver to load but
nothing else... then I
can run 'most' programs now that I wasn't able to before.

This one has me stumped though... I downloaded a game demo called
Black Hole?

Well, when I run it (no matter HOW I run it, HD/CD, hold shift/control
on boot, in multitos, rgb or vga (even tho I did it in VGA because
that's what it said it required)

It gives me this message:

"Sorry, this program runs on the Falcon030 only."

WHAT? This IS a Falcon030!?!? :)

Anyone ever get this program running?

Thanks for the info and link about Magic... it is in english too
though right?
Do you recommend me getting Magic? I know it's not needed... but...??
Or should I just keep the desktop as it is? Is the performance nice
with Magic?

I know, so many quesitons? ;)

Also, where can I obtain Crown of Creation 3D?
I heard this is *the* game to own for the Falcon.
Does it utilize a FPU at all? =)

And back to the NVDI problems... I hear/read it increases speed of the
desktop quite a bit...
any ideas?

Thanks much!

Clint Thompson

Hi Uwe and Hades users,
Is it true that a hard drive (on a Hades) must be reformatted just to upgrade from HDDriver 7.01 to 7.8 ? It doesn't sound logical to me but that's what a Hades user told me!!!
If I remember correctly, whenever I upgraded, all I had to do was run the new version and install with the corresponding utility app (8.04 now on my Falcon and an old 1 gig Seagate)!

What's the saying again?
Ignorance is bliss?

Dennis, you should have known/realized that singletos with older AES does
not support color icon, how do you think papyrus displays them?
Come on,

You know it...

It's on the tip of your tongue...

By its custom code!!! DING DING DING! thank you, that was the correct
answer.

It has been established that Dennis is slandering
some people and products here on totally unfounded facts.
Furthermore, Dennis shows his inability to comprehend the topic of this
discussion. His lack of technical skills proves him wrong everytime, yet
keeps coming back barking like a dog.

Who takes Dennis seriously?

No, seriously I mean.

No further comments.

No I will not explain why as you don't have the patience, nor the brain
power to comprehend.
Or maybe someone else will have the patience to explain it to you.

> Why would I update my Calamus which runs *perfect* under both TOS and MagiC?
> One has to do more then just update Calamus, there are also a lot of modules
> which need to be upgraded, all in all that costs a small fortune.

You're right, that is so wrong for Calamus author to update and clean
the code. After all, as long as it worked on tos 1.04, it should work
everywhere.
btw, is magic running on the 060?
If so, does it use the 060 to take advantage of the new cpu? (as in, be
more efficient and faster).
If not, is a patch necessary? like the magic.ram has to be "hacked"?

> Why should I spend all that money, just to get it running under MiNT? That
> "unclean" app runs even perfect under TOS. It seems to me that there's
> something not very clean in either MiNT or N.AES that needs to be cleaned...

why spend all that money? if you want to keep your "not quite clean old"
version of Calamus, just reboot in singletos, do your deed and that's it.
For people that NEED a stable multitasking and don't want to reboot as
they are running services and their atari needs to be on for weeks, maybe
they will appreciate the fact that the Calamus author decided to clean the
code. That's up to you man, nobody is forcing anything on anyone.
Singletos is STILL there in the roms you know, and to boot, less than 5
sec.

> >Magic has changed the behavior of some of its API, why? no apparent

> >is superior, you are a moron.
>
> Sorry Fredric, you've lost me.... I've no idea what your on about, but I can
> tell you that Texel works great under TOS also...

hmm the version I had did not.
Are you telling me that they cleaned the code since the version i tried?
to be..... more singletos compatible??

Nah, couldn't be. Like you say, if it runs in magic, it's GOT to work in
singletos, so no need to even test it, or change it for singletos.

>
> >See, if magic (as buggy as it is) was to respect the APIs already in place

> the major softwarehouses and developers in those days followed the MagiX
> standard (it was the only one available). One could even say that the standard
> was already set but that like usual Atari Sunnyvale had no clue, and screwed
> it up.

as far as I know, MagiC just allows to multitask the singletos
application that had been out. No major changes in the API was necessary,
as no application didn't need to be recompiled to run under magic.
MiNT on the other hand has implemented a LOT of stuff, yet tries to remain
TOS compatible. Dirty application sometimes even rely on OS bugs. What is
the proper way to create a new OS?
To re-implement the bugs in the new OS, so the old application would work
as expected? Or might as well fix the bug, and the applications that
relied on the bugs should be patched/recompiled.
You tell me what is the best approach.

> sorry that it never reached your part of the woods, if it would have. Then
> surely Eric would have had a good look at the MagiX's internal, and bam, same
> features.

hmmm magic, last time I checked was closed source.

> Does it utilize a FPU at all? =)

Nick Harlow at 16/32 systems (www.1632systems.co.uk) stocks it. I have not played it much due to the memory limitations of owning a 4 Meg Falcon. Its not bad and has good graphics and sound and is also Jagpad compatiable - however I was disappointed in the Elite style direction control though, as with Frontier it makes it very difficult to shoot down fast moving enemies, whats really annoying it that programming eight directions is not that difficult!
Just a couple of things to watch though...
1) your need at least three Meg of memory available just to install when I installed my copy and play it I have to remove all my accessories and autofolder programs except Fpatch to get it to run.
2) The music volume at the start is full volume and there is no way of controlling this untill your into the game and have created /selected a pilot even then the adjusted volumes only work from this point in the game every time you play and so the start volume is always loud.
If you have disconnected the Falcons interal speaker in favour of external speakers connected to the headphone socket this should not be a problem.
3) All non space (flight) sound are routed to both the interal speaker and headphone socket however on my copy the flight sounds (engine noise, weapons fire, ships computer) are only sent to the headphone socket.

5143. Question about Atari desktops

Newsgroup: comp.sys.atari.st
Date: 2003-07-31 08:35:25 UTC
From: Graham Stoneman <graham.stoneman@freenet.co.uk>
Message-ID: <bgakcc$8fm$1@hercules.btinternet.com>
Source record: 25074

Hi,

Many years ago I used an Atari 520STFM, with a whopping 1Mb of RAM. A few days ago I thought I'd return to my roots, so dug it out and fired it up, but I'd forgotten how horrible the desktop was...

I remember reading in Atari magazines, adverts for a product called MagiC - it had a screenshot of a glorious high resolution, full colour desktop with lots of windows, open applications, full colour icons etc... (much like a modern Mac desktop looks like).

Now I'm guessing that those screenshots weren't from an Atari 520ST (what with it only having a 320x200x4bit screen). What hardware and software do I need to have an Atari desktop like the ones in those adverts? Does anybody else remember them? How is it possible to have an 800x600, or even 1024x768 full colour desktop on any Atari system?

Many thanks,

Graham.

Well you're mentioning a lot of different aspects at once. :)

The screenshots of Magic in glorious high resolutions are usually made in MagicMac, which runs on a Mac in any resolution supported by the Mac itself.

On the ST, there's not much you can do to achieve those resolutions. On a Falcon you can (using accelerators to increase the bus speed), or on a TT with a video card.

Furthermore, you mention the desktop itself. There are replacement desktops even for the ST, like Thing and Jinee. Magic is mostly used with Jinnee or the default MagicDesk.

Then the looks of the GUI itself, the last versions of Magic as well as N.AES (a gem-environment for use with MiNT) support "Themes", in which you can basically control the complete look of the GUI, down to the bitmaps displayed in the window fuller/closer etc.

But anyway, for the fancy high resolutions, you'll need to resort to more powerful Ataris (TT, Falcon, Milan, Hades), or an emulator on the PC or Mac.

Maurits.

Thanks for the reply - would either a TT, Milan or Hades be able to run ST software (I know the Falcon often has problems).

That must have been a misleading advert I saw all those years ago then, using Mac screenshots in an Atari mag, advertising an Atari product...

Graham.

Actually the Falcon is (supposed to be) the most ST-compatible of them all. (This is why they made the somewhat strange step backwards from the TT, with a 16-bit bus and a 16MHz processor). With cleanly written software, none of those systems has problems. As the software gets older and dirtier, the Milan/Hades, TT and Falcon will fail (in that order).

Modern Atari software should run on all those systems. Stuff like Calamus actually kinda depends on the memory and resolution possibilities of a TT or Falcon, although it should still run on a 4MB ST (barely). :)

It all boils down to what you want to use your Atari for. If it's all about old ST games, stick to the ST. :)

> That must have been a misleading advert I saw all those years ago then,
> using Mac screenshots in an Atari mag, advertising an Atari product...

Depends what the product was. :) The German magazine "ST Computer" (of which the last issue came out a month ago, now it is a supplement in a PC magazine) does this all the time. Emulator users are considered a serious group of "Atari users".

Maurits.

I didn't reformat to go from 7.55 to 7.63.
That sounds strange to me. You do want to be careful which version of HD Driver you use on the hades as some have cache issues.

As far as the Hades is concerned you can be sure that the current
version 8.12 of HDDRIVER works without any problems. One of my beta
testers has a Hades.

Hi Lonny,

>Dennis doesn't do any coding, but he thinks he knows all this coding level
>stuff. Yet Magic is the one the doesn't follow the standards, especially in
>the documented look of 3d objects. I have the developer docs directly from
>Atari, with example code and the works.

Back in 1987/1988 there were no standards set on the look of 3D objects (the morons in Sunnyvale only woke up 3 years later) the programmer had to invent the wheel. And considering it took another 18 months before the Atari docs ever got translated, does it really surprise you that a lot of the European programmers used the MagiC docs, which are just as well documented?

The facts are simple: a standard was set and used by many programmers years before Atari released their "standard". And since hardly anyone wanted to know anything about MultiTOS it was ignored. Only when MiNT became open source and development continued this all of a sudden became an issue. A standard is not something which one sets, a standard is what the majority uses. For one reason or another most of the programmers like to use the "alternative" standard...

BTW: do you really think that only people that can code are able to read the famous Atari developers docs? wake up...

>Anyone that says magic does these things correctly simply ignores fasts and
>documents from Atari.

Atari is dead and AFAIK they didn't leave a will.
The MiNT developers and users obviously think that they've inherited the legacy, fine... so what's next?
Are you gonna sue everyone who doesn't use the "real" standard?

Cheers from Belgium

Yep... you can order an English, French or German package straight from
the distributors. In less then a week it will arrive at your doorstep. If
you're in a hurry, they'll email it and send the manual by snail mail.
Now try this with Woller...

>>It's not exactly cheap either for what after all is only a AES. You
>>decide to use Jinnee as desktop, since you've already have it and don't
>>want to spend extra money on Thing. It's not the money which is the
>>issue but the fact that with every new program you install, there's a

>like a mailserver and other things the atarian you descibe wouldn't
>probably need), the things I learned appeared to be very handy knowledge
>in the real computer world, at first to my surprise (now I'm used to it).

Well yes then you're super intelligent :-)
To stay with the example: even with a fairly easy program like Thing one
needs to spend time on it, to get to know the ins and outs. Like most
people I don't use the atari to make a living, it's my hobby computer, and
sad as it is, I simply don't have enough free time :-(
I didn't say that the things you learn were useless, but when your time is
limited, you have to make choices.

>>you can even use STiNG/STiK clients if you prefer to do so... after a
>>very short time you realise that your iconnect clients aren't all that
>>bad as some would like you to believe...
>
>Why is this exactly? In your little story I am missing the point why
>MiNTnet is so unusable. The configuration parameters are the same. Oooh
>I see, you have to enter them in a text-based setup program that asks
>you for the parameters, instead of a 3D dialog. Silly me.

It's because we're talking about a newbie here, someone who still has to learn the ins and outs of MiNT, dropping him straight into MiNTNet would be fatal. And yes I think it's lots easier to enter your parameters in an easy to use setup program. And if you think that's crap just look it up in Google: there must be hundred of posts about people having a problem with even getting something relatively simple like STiNG set up correctly. You won't find many Iconnect related posts, not because there is hardly anyone using it, but because it's been made so damned easy...

>>You've anticipated a couple of problems while switching to MiNT, but
>>nothing like this... your trusty reliable stable Calamus SL95, keeps
>>crashing.
>
>I can't speak for Calamus SL95, but 2000 works like a charm in n.aes. Oh
>yes of course it's yet another version to buy. Well when I was still a
>Magic user, I had Calamus S2.0 and I really had to boot to singletos to
>make it usable.

OK, I admit that using SL95 as an example is a little over the top, but it's only since version 99 that all the problems with MiNT are solved. I remember using Calamus S 2.0 also, and I also remember TOS bombing out on occasions. That particular version wasn't very good....

>>Atari is a hobby for you, and you have a family to support.... and the
>>budget is in the red this month, you really can't afford to spend 200
>>EUR updating it,
>
>149 euros if you update to SL2003. And SL2000 is probably for sale for
>less if you find it (left-overs at dealers, or second hand).

Yes and no, the update for the program itself is reasonable, but there's also the matter of the modules. A quick calculation tells me to expect a 750 EUR bill, and that's a bit to steep....

>>so you reboot the computer and boot Calamus in MagiC.
>
>FATAHLER FEHLER :) That's what happened last time I ran Calamus in
>Magic. Since then, both have been improved so now it works. But, as you
>say, not worth the money is it.

Calamus S was released in 1990... the examples I gave were released after both MagiC and MiNT were more or less established.

>> DO I HAVE TO GO ON???????
>> I can give you at least another hundred examples of how the combination
>
>> MiNT/NAES fucks up....
>
>Likewise. :) But just read through this thread and the hundreds of
>others before this. Your little rant about n.aes-incompatible software
>really doesn't make a point because the problems the other way around
>are the same. In addition to that, the Magic incompatibilities are
>caused by Magic violating existing AES specifications (and programmers

>following that).

Oh no...
It's a one way problem only. MagiC incompatibility may well be caused by violating existing AES standards, but that's not relevant, because you said it yourself :"programmers following it"...
Today in 2003 it's easy to say this, but back in the late 90's it was a different situation. I think most of us only heard about MiNT still being developed after they went on internet. Information about MiNT was very scarce to say the least, dedicated atari magazines didn't even mention it. As far as most users knew there was only one multitasking OS. Furthermore I personally know that some of the most famous German programmers weren't aware of MiNT development. In these circumstances they did a very logical thing, they developed their software following the standard set by the most widely used multitasking OS on this platform.
Then all of a sudden N.AES saw the light and users gave MiNT a go, I still wonder until today why the N.AES developers choose to implement the "real" AES standard, surely they must have known very well that this would cause incompatibilities with the majority of existing software. Anyway, almost every new release of software can cope now with both. But problems remain with software that isn't further developed anymore...

>> MagiC users are being told that MiNT is 100%
>> compatible with TOS,
>
>It isn't, and I never saw anyone say that. On the other hand, Magic
>certainly isn't either. It's actually worse (because of the above
>mentioned specs), but a lot of programmers followed Magic's wrongly
>re-invented wheels. Until recently that is, but you "sweep that point
>under the table" by saying people shouldn't upgrade their software.
>
>Nice :)

Some people here did say it was 100% compatible, but if someone says that *any* GEM app runs perfect under MiNT, and that has been recently said then I interprete it also as being 100% compatible, or should we redefine the word "perfect"? Nobody ever claimed that MagiC is 100% compatible, the users don't, the distributor doesn't and the programmer doesn't. I think that every MagiC user is very aware of this. MagiC re-inventing the wheel is simply not true.... when MagiC was developed there wasn't a wheel, the programmer invented the wheel. But that's a fact which is overlooked for convenience sake, it's much easier to say that it's not compatible with standards which when introduced nobody took seriously. The development of MiNT as we know it today started some eight years later then MagiC, the developers of MiNT could have been a little more realistic and then a lot of incompabilities could have been avoided. If all those standards were so good why is it that MiNT doesn't follow all of them? it seems to me that the developers are quite selective, if it doesn't suit them then they forget all about the holy rules, if it suits them they implement them and then you can all have a go once again at that oh so incompatible MagiC...

>>Oh... I have a USB based DSL connection here, now if any of the MiNT
>>power users could explain me how on earth I get this thing attached to
>>my Atari TT or Milan060 without the need of networking it to a Mac, they
>>might just convince me to start using MiNT.... at least for internet
>>use. Are there (ported) DSL drivers available for MiNTNet?
>
>There are DSL modems that speak plain ethernet, so that would work in
>MiNT and even in Magic.

I know there are, but not here in this "apenland", the phone company only
has USB kits...

>Anyway, it's probably not that difficult to port pptp (which is what
>most dsl modems use) to MiNT. I think someone is already working on it.
>But hey, you don't want ported open-source software. So I guess it's not
>for you.

Ofcourse it isn't.... all one needs to do it take the source and run it
through a compiler, at least that's what I've been told and learned from
this thread . Have you any idea how many times I've heard someone singing
that particular song? "it's not difficult to port", "we only have to port
it" etc.... and then you and some others here are amazed why I make such a
noise?

>By the way, when is the iConnect driver for DSL coming?

Unless someone happens to port a DSL driver one of these days, I wanna
make a little bet with you: that driver will be here before the second
quarter of 2004... there's more in the pipeline then you think.
So what about it? If I loose I'll send you a six pack "Duvel's", and if
you happen to loose, you send me a six pack "Amstel Gold"... :-)

Cheers from Belgium
Dennis

Hi Maurits,

>But anything is possible I guess. When ASH sees no more commercial value
>in Magic, they MIGHT release it (which to some people here would mean
>it's dead but would actually give it new life), it could become a MiNT
>AES and it would end all discussions. :)

ASH only sells and distributes the OS. The only one who can release MagiC as
GPL soft is the programmer himself. The fact that he's working further on
MagiC should tell anyone dreaming of a GPL'd MagiC to wake up and let's not
forget that on the Mac platform there's also MagiCMac. Stop dreaming, it
won't happen. What will happen for sure is that somewhere in the future a
new version of MagiC will appear... a commercial one, some people like to
be payed for their efforts. You can either agree or disagree with this but
it won't change a thing. Personaly, the idea of a bunch of people fucking
around with MagiC would make my stomach turn.
MagiC is fine as it is, people using it, have made a choice, and they are
aware of the pro's and cons. If the cons are issues which don't matter to
them, they'll be very happy users. And although you think differently there
happen to be are a lot of happy MagiC users out there...

Hi Mike,

>and I like Magic for its far superior (in my opinion, other
>than its lack of AES 4.1 support and lack of support for >6 accessory
>slots) GUI and small size (and thus faster speed, for some
>applications).

MagiC indeed only allows maximum 6 accessory slots to be occupied, but you can load and work with as many as you like in practice. MagiC treats an ACC like it's an APP, all you have to do is double click on a ACC and it'll run. You can terminate and throw it out of memory just like any other app. So what it comes down to is that you can run as many ACC's at once as the computer memory permits.

Cheers from belgium

Hi Maurits,

>>time which we
>>unfortunately haven't got anymore. So, it's essential to keep this
>>platform going that new software can run at least under MagiC and if
>>possible also under TOS.
>
>Yes, let's all point our developments to the platform that has is
>abandoned by its developers and has no way of porting other things (like
>the DSL driver you want), so that the few programmers left will have to
>rewrite anything from scratch and have no hope of an OS update ever
>coming.

Did you say "our" developments? Sorry but taking a source and running it
through a compiler doesn't really qualify as a developement, and the few
remaining *real* programmers just happen to create something from scratch.
For one reason or another these programmers luckily aren't narrow minded
and do their very best to make sure that their creations run on all three
OS's...

>>If only to make sure that all the Joe's remain
>>here, we need them to be a platform... no one in the real world will
>>take a (devided) group with a couple of hundred people seriously...
>
>Aha, so this is where your brainwashing efforts are coming from. Well

>because there is something for everyone (GUI-addicts, Unix freaks,
>Spartanic TOS gamers). And (outside this newsgroup and some
>mailinglists), *respect for their choices*.

I'm speechless.... we actually agree on something :-)
If we wanna keep that diversity of users then new developed software must
take them in account, that's also a way of *respecting their choice*, if
software suitable for one OS only is released, then that's disrespectfull
also.

>I would advise you to let Joe continue to use Singletos, and me to use
>MiNT. Convert us to Magic and Joe will switch to a playstation and me to
>Linux. (Well, I'm already using Linux, and OS-X, but they still work
>happily together with my Ataris). :)

Did you have the impression that I was trying to convert you to use MagiC
again? Sorry, but I know when someone needs MiNT, and the things you do

can't be done under MagiC... but if someone who still uses TOS and is playing with the idea of switching to a multitasking OS, and according to his needs, I'll advocate using MagiC.

Off topic:
Take a look at http://www.linuxiso.org , there's a three CD Linux Mandrake 9.1 set ready to download there for the Mac, the files are in ISO format and must be burned afterwards with Toast.... you'll love it.

Cheers from Belgium

>an Atari Falcon running Magic 6.20? I know it is shareware
>but where can it be obtained? I am interested in using it in
>conjunction with PhotoTip for scanning in old non-digital
>photos.

No, the Epson GDPS_SC driver doesn't work with the Falcon, it only works
with a TT and Milan with SCSI card (possibly the Hades also). The driver
works under TOS, MagiC and MiNT. It recognises all the Epson GT scanners
and also some (not all) of the later models.
I've found it on a now defunct German BBS.... if anyone wants a copy just
drop me a mail (I've translated it in English). Although the software is
shareware the author can't be found. Letters are returned and his email
address doesn't exist anymore... the driver itself isn't crippled in any
way.

>With PhotoTip and using the last NVDI (5.03) and a printer
>driver for the 600 it gives me the option of printing at the
>higher res (Best - 720 & Best - 1440) but when selected either
>all I get is a brief alert box flashing up on the screen
>"Initialising Printer" or somesuch, and then nothing happens!!
>The maximum res I can print at is Normal - 360dpi, even with
>the best glossy paper in the printer.
>
>I have a Falcon CT2b with 14Mb and 64Mb FastRAM so I thought I
>must have enough memory for printing at the higher
>resolutions?

Not really, you need minimum 128Mb RAM but to be on the safe side I would
say 180Mb is even better. If you haven't got that amount of free RAM then
the only option left is to use NVDI's spooler.
Check that you've set the spooler path correctly and that there is a folder
called "spooler" present. Also make sure that there is at least 200MB free
space on the partition where the spooler is located. Printing at 720*1440
garbles up memory....
Oh and if you have a dog, take it for a large peewee, printing an A4 in
that resolution can take quite some time....

Cheers from Belgium

There was a really good demo of a pinball game made by
some new (at the time) swedish (i think) software house.

I can't remember what it was called, but I'm pretty
certain the demo level provided had an aquatic theme.

It was cool.

It also required a meg.

I think of myself as fairly competent with a computer, and Ataris in particular. But I still haven't found out how to install applications in Jinnee yet... Have to read the manual I guess. So for now I drag'n drop every file I want to open on my MagiCMac setup.

> Then all of a sudden N.AES saw the light and users gave MiNT a go, I still
> wonder until today why the N.AES developers choose to implement the "real"
> AES standard, surely they must have known very well that this would cause
> incompatibilities with the majority of existing software. Anyway, almost

N.AES implements most (all?) special objects introduced in MagiC, the only real difference is the way 3D borders are drawn. N.AES does it like Atari Corp. did. MagiC doesn't. From a programmer's point of view I prefer the first.

> wheel is simply not true.... when MagiC was developed there wasn't a
> wheel, the programmer invented the wheel. But that's a fact which is

Just because the first version of MagiC was introduced in 1990 (1989?) doesn't mean that all of MagiC's features was introduced then. When did the 3D look arrive? In MagiC 3? Colour icons? MagiC 3? Wasn't it? That was in 93 or so. I remember running a patched version of MagiC 2 on my Falcon, and it did definitely not support any 3D objects or colour icons.

> development of MiNT as we know it today started some eight years later
> then MagiC, the developers of MiNT could have been a little more realistic
> and then a lot of incompabilities could have been avoided. If all those

The difference isn't in MiNT - it's the AES. MiNT does contain a lot of stuff MagiC doesn't, but what's common is also compatible. Perhaps with the exception of the XFS/XDD-interfaces.

When it comes to the AES I also prefer N.AES - but again this is from a programmer's point of view. Some of the extended features in MagiC are just horrible to use, like the WDialog extensions (horror!) or controlling applications (sending messages to the screen manager). But some of the other stuff is nice, like the new object types and menu_popup().

> implement them and then you can all have a go once again at that oh so
> incompatible MagiC...

Most of MagiC's extended AES features has also been implemented in both
N.AES and XaAES. When it comes to the GEMDOS there's not much to support -
it's plain old TOS GEMDOS.

That Hades user surely is wrong. One doesn't need to reformat the
hard disk to update HDdriver.
Be aware though some versions of HDdriver (I believe from 7.8 to 8)
doesn't work very well with the Hades, especially when one have
scsi-devices connected. However the version I've (8.01) does work very
good.

And where does Lonny say anything about "stolen Hades"? This is one big
misinterpretation, reading the above as "stealing a Hades". Get it right.

> computer memory permits.

I know this is pretty picky, but that still bugs me. I have some ACC's
that *have* to be used from the accessory slots in order to be
available to other programs or to function properly. Because of these,
my accessories have to be spread out in different locations, rather
than being able to have them all in one place. I personally don't see
what the problem is with at least giving the user the option of having
more than 6 loaded into the slots. Let the user decide whether or not
to put things there. All other Atari GUI's allow it, why not Magic? I
hate software that doesn't leave options open to the user's own
judgement.

Actually, what I'd like to see them do is this: Allow the user place
the ACC's in a folder, instead of on the root directory (although they
can be there, too, and function as usual). Put an "Accessory"
sub-directory on the desk menu, where both the ACC's and the APP's in
this folder (or even PRG's or anything else, I suppose) can be
displayed. This function can also be disabled, if the user wishes, to
either be used as Magic normally does it, place all ACC's and APP's in
the main part of the desk menu, where they normally are, or not there
at all, so the user must click on them in their actual directory
location to make them function. I suppose they could also build in
AT-Menu-like or MacOS-like functions so that any folder, file, or
program placed in a pre-defined location will appear in the menu. That
way any ACC's and CPX's found there will be loaded as usual, but
available through Accessory and Control Panels menus, as well as
anything else the user wants to put there. Maybe put in DHST

compatibility, etc. It's been done through other programs, but not as functionally as this could be if done directly through the OS.

But that's just me. I like things neat and tidy and easy to get to instead of spread out haphazardly all over the place.

> new rules, that explains a lot ofcourse....

No. Often there are rules like: "don't do that! instead of x do y!", and even if you do x your program will work ok. How come? In some cases rules are created before actual OS solutions becouse OS developers know what will/can change in future version of OS. Not listening to that rules is a bad tihng, and a short-thinking strategy.

>>Let us think how Magic and FreeMiNT handle filenames. Under Magic, filenames

I do not remember if Atari ever made a standatd about sensitivity of filenames in whole OS (not only on TOSFS partitionos), so somebody with good knowledge please correct.

> compatible?

1. Our computers are Atari or Atari clones, they run TOS compatibile OSes..
so who makes the rules?
2. MiNT has (almost) all MagiC features, only some of them are extended.
I've heard there are some patches for MagiC to also use those extended
features, but that is to be confirmed.

> Oh, I can't remember ever coming across an application that screws up the

5181. CT60 : PCI card !

Newsgroup: comp.sys.atari.st
Date: 2003-08-01 09:50:48 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3f2a37f4$0$1751$626a54ce@news.free.fr>
Source record: 24963

One thing that is boring me since several years on atari universe, is that some people (stupid !) spread some faulse rumors about things they have never verified !!!

I received several mails about people telling me that they read somewhere that the PCI card is cancelled because of the Supervidel ...

PFFFFF !

I NEVER WROTE THAT !!!

SO HERE IS MY PAROLE :
And I hope it will stop the stupid rumours !

THE PCI CARD WILL BE ON CT60 !!!
Except if I'm too nervous & borred with those fxxxxxg rumours !
Or if not enough people ready to buy... need at least 60.

The LOCAL-PCI BRIDGE will be the EXCELLENT AND VERY POWERFULL PLX 9056, a 66 MHz core allowing 66 MHz direct connection on 060 (very speed) bus and on the other side (PCI), you will have PCI at 66 MHz or 33 MHz depending of the M66EN signal activation on the several PCI slots !
The norm is here :
You plug a PCI 66 capable card and you get a PCI at 66 MHz !
Normally , the PCI Graphical card will allow that because the chipsets are the same than whose with AGP interface and AGP 1x is 66 MHz !!
I may add an experimental AGP slot to try to use AGP cards with PCI protocol...

If you plug a second card that is not 66 MHz capable, the signal M66EN is invalidated and the PCI bus is clocked at 33 MHz...

These are the base of the design...

I may add a second IDE port (3.5 connector) if Uwe Seimet is ok to support it ...

Regards

Without it, you would not have ICQ on Atari.
The usual, they can't win an argument, so change the thread.
I also stated, if they are so dam smart, find a portion of code
I have taken. They can't do that, no smarts for it.
End of subject.

>So what it comes down to is that you can run as many ACC's at once as the
>computer memory permits.

The MagiC booklet says that the use of ACCs is against the spirit
of MagiC, presumably since multitasking makes ACCS unnecessary. I
personally disagree, as there are some ACCs that don't have a
direct PRG/APP equivalent, or, like ST-Guide, need to be installed
for Help to work from within programs (but possibly running the
PRG version in parallel might work as well - I've never tried).
Also it's often easier to launch an installed ACC, since it's
available from within (nearly!) all running programs that may
cover all the screen area.

The subsequent loading of ACCs in MagiC is extremely useful,
though I have come across a couple that refuse to load this way
(can't recall which now). Terminating ACCs with ALT+CTRL+click on
their menu entry works with most but not all - or rather with a
few ACCs that hook deep into the OS (Harlekin being a prime
example), the computer locks up or crashes soon after the ACC is
terminated with ALT+CRL+click or kicked out from the APPLINE
task-bar. But this is, I suspect, due to some liberties taken by
Harlekin etc. rather than the fault of MagiC.

BTW, can MiNT load/unload ACCs on the fly? (This isn't point
scoring - I really don't know!)

Regards, /Peter/

Very hard, as I've lost the source a long time ago... Or to be more
precise, I do have the source but large parts of it was corrupted in a
disk crash many years ago.

There already us V-desk for N.AES from Jo, but as separate application...
I dont know if it work in Magic, or how hard it would be to make it Magic
friendly.. Jo?

Janez

P.S: otherwise taskbar offer similar mode, in which only selected app is
shown, the rest are hidden... I prefer V-desk and it works rather well,
altough few apps can have some small problems.. Another similar program is
TWSM, which also include rendering window positions etc in thumbs for each
desktop.. But i prefer V-Desk, its snappier...

> scoring - I really don't know!)

Yes, hold control and click a desk acc entry in the drop down menu.
I think it is N.Aes that does it, not the kernal.
Also not all acc's unload, but most seem to.

5200. Video CT60

Newsgroup: comp.sys.atari.st
Date: 2003-08-02 00:42:46 UTC
From: Xerus <falcon060@free.fr>
Message-ID: <3f2b059b$0$28816$626a54ce@news.free.fr>
Source record: 24981

Hi,

if someone has doubts about the CT60's power and hesitates to buy it,
i have made a little Quake's video : http://falcon060.free.fr

The 060 is clocked at 72MHz and the Falcon bus at 25Mhz...
The screen output is done by the.. Videl !

So, I let you imagine the result with the future Rodolphe's AGP/PCI
expansion card.

Just for information, this card will be driven by a PLX9056...
Of course, the possible 'SuperVidel' will be also a good solution.

If someone wants to write the OpenGL part of the video's driver,
he is welcome !

Cheers from France,
Xerus.

I also love TaskBar. Wonderful little app.
Only thing I can think of is the priority settings, if I recall the
rsc or something changed and I couldn't adjust the priority of a process.
Unless I've mixed up 2 installations or something. Other than that it
works super on the hades.

Rodolphe,

I'll get in on that but I'd like a projected time of completion (like the point where beta boards are going out). I'll make sure to add 1.5 years to that in my figures ;-) Just kidding with you :) And also the cost while not very important is something we need to know too. PS: I hope it is not much more than $100 since it is only single component? Maybe development costs are higher...

Thanks,
Mark

Hello all,

This may be a fight starter but I was just wondering if anyone ever successfully ran Magxdesk under N.AES or XaAES. Reason being is that contrary to what others might say I have always loved magxdesk. To me it is clean, pretty and has the right features. I know there's a lot of sticking points with that so I was wondering if anyone ever accomplished it or even tried?

Thanks,
Mark

Of course I know it isn't Czuba's fault, but I will also note that it took quite a bit longer than first indicated to finish the CT60 as well as other projects Rodolphe has made. I will not hesitate to playfully tease Rodolphe about this, but at the same time he should know I and many others have the utmost respect for his work and I would have waited 2 more years for my CT60 to be finished. But I am in Philadelphia... It really really shouldn't take very long but alas the US mail system is the US mail system. I got my EtherNEC's from the UK in record time.

TAMW (Tims Atari MIDI World)
http://tamw.atari-users.net

Importance Notice

As of Aug 7th, 2003, Yahoo groups is no longer allowing public access to the file sections. You will need to become a member of that particular Yahoo group to be able to access these files . This affects TAMW as there are a lot of links directly to the software on these file sections. This means, I will be moving the actual files as well as re-creating the pages and links to those files. This will take time. If you come across a file that you cannot access on these pages, you can wait until I re-create the page, or simply join the Group.(Atari-MIDI or Atari-MIDI Archives) Details below.You can choose as an option when joining for WEB ONLY and then you can access the files. Please be patient as I am reworking these pages.

http://groups.yahoo.com/group/atari-midi
The Atari-Midi Mailing List Home Page.

http://groups.yahoo.com/group/atari-midi-archives
Atari-Midi-Archives Home page

Simply click "JOIN THIS GROUP? " and follow the instructions. Click WEB ONLY if you do not want to recieve messages to your in-box. Be sure to create a Yahoo profile as well as this will allow you into the file sections.

Note: Rob of Atari-Users.net has graciously agreed use of his server for these additional files. Thank you Rob!

I removed this feature after a short while, because I never could get it
to work correctly. Also, at some point there were some changes in MiNT so
setting priority from Taskbar didn't work at all. Rather that trying to
fix the buggy old implementation, I just removed it... It might come back
some time.

>-->
>Regards, Steve. S.

Hello Steve,

The basic problem was when I booted up the program. It kept
telling me that it could not load in the printer driver, so I
could not print. After reading the Gemvelope manual I saw that it
considered, in the assign.sys file, #21 as the main printer
driver. Well, the assign.sys file for NVDI uses #21 as the driver
for HP Printer and I use an Epson Photo 700. I bascially just
created another assign.sys file that has uses the Epson printer
driver as #21 (ESCP2.SYS). When I booted the Hades using this
assign.sys file, Gemvelope loaded in and print beautifully. Of
course all of this is for people who have NVDI I would think and I
also re-did my assign.sys file after I was done using Gemvelope. I
also found out that under Magic I need to use the ACC version as
the PRG seems to crash now and then. Under Geneva and TOS, I can
use either the PRG or the ACC file.

Hello John,

That is not the case for me. I never had to reformat any hard new
hard drive when I installed it. I also got a new 3 gig Seagate and
it worked fine when I first loaded it up. The only thing I have
had to reformat was one of my Jaz carts.

Yes, I tried it and it did not work mainly since Magxdesk is only
for Magic. I use Jinnee 2.5 for Mint/NAES.

Hello Graham,

You would need an Atari computer that has a graphics card like a
Hades or Milan. Also a Falcon will do nice desktops in 256-colors
right out of the box. Add a graphics card and you can go higher.
Also, a TT will do the same. On my Hades I can do a 32-bit screen
in 1024x768 resolution.

Why would you want to do that? Many of those games usually require the
JagPad, meaning that even if you're able to do so, you would only have use
of one button for a game that requires more. Besides, it's far easier to use
a JagPad, as the port isn't "conveniently" situated on the bottom of the
case.

Well because I want to use a joystick on my Falcon! I don't own a JagPad.

I'm not trying to shit on your parade or anything, but JagPads can be had for pretty cheap. And seriously, you would most likely lose out on functionality in a game were you to use only a 1 button joystick with it. I would recommend just getting a JagPad over going through the trouble of using some utility to convert JagPad games to use a standard joystick.

>Based on my experience with Aniplayer on my Milan060 I'd guess that
>Aniplayer would use somewhere between 20 and 30 seconds to decode a 1Mb
>mp3-file. The difference between MiNT and MagiC in this case would be very
>close to zero. I can't say which OS will "win" such a contest.

I don't think so...

The decoded file must be written to the hard disk, Aniplayer usally writes bits and pieces as it moves along... since MiNT has a non re-entrant file system opposed to MagiC, meaning that whenever Aniplayer access the hard disk MiNT is idle, MagiC on the other hand will continue happily decoding the file.
A 1Mb mp3 file isn't very realistic, an average file will be more like 4Mb large, equalling 50Mb when expanded as a WAV file. Writing a 50MB WAV file to the Falcon hard disk takes about 20 seconds all in all, 20 precious seconds that MiNT is idle while MagiC is doing his thing. So assuming that it takes on average 2 minutes to decode a 4Mb mp3 file under MiNT, MagiC should be capable of doing the same thing in roughly 15 secs less, and that's a difference of almost 10%. Assuming that Carey would decode a complete CD (650MB) (13 tracks), he would be finished almost 3 minutes before you, meaning he can decode an additional track...

So, the OS used does make a difference.

Cheers from Belgium
Dennis

From: Frederic Fouche <g213778@coazter.com>
Date: Wed, 30 Jul 2003 21:30:55 -0500

Hi Frederic,

>btw, is magic running on the 060?
>If so, does it use the 060 to take advantage of the new cpu? (as in, be
>more efficient and faster).
>If not, is a patch necessary? like the magic.ram has to be "hacked"?

A patch doesn't necessarily has to be a "hack".
But yes, magic.ram needs to be patched in order to run. So what? I don't see the point you're trying to make, a MagiC user patches the kernel, and a MiNT user puts a different kernel in the Auto folder. The end result is exactly the same... both OS's run happily.

>>Why should I spend all that money, just to get it running under MiNT? That
>>"unclean" app runs even perfect under TOS. It seems to me that there's
>>something not very clean in either MiNT or N.AES that needs to be
>>cleaned...
>
>why spend all that money? if you want to keep your "not quite clean old"
>version of Calamus, just reboot in singletos, do your deed and that's it.

You're pulling this whole thing out of context.
This is about someone upgrading or switching to MiNT, and coming to the conclusion that some of his apps which used to run under *BOTH* TOS and MagiC all of a sudden don't work correctly anymore. So he can do two things: upgrade the apps (if possible) and spend a lot of money without really knowing if the apps in question will work correctly after the update, or he can just leave everything like it was... the point was that the apps the person used actually ran just fine under MagiC.

>>Sorry Fredric, you've lost me.... I've no idea what your on about, but I
>>can tell you that Texel works great under TOS also...
>
>hmm the version I had did not.
>Are you telling me that they cleaned the code since the version i tried?
>to be..... more singletos compatible??
>Nah, couldn't be. Like you say, if it runs in magic, it's GOT to work in
>singletos, so no need to even test it, or change it for singletos.

Well the version I have here works under TOS. And as it happens all the previous versions I ever had ran under TOS also, so something wasn't quite setup correctly at your side if you ask me.
Gee... Frederic setting up something incorrectly!! maybe those German docs

that I feel so "totalitarian" about have something to do with it?
BTW: I've just checked it: Texel 1.0, 1.6, 2.0, 2.1 and 2.2 run correctly under TOS.

>What is the proper way to create a new OS? To re-implement the bugs in the
>new OS, so the old application would work as expected? Or might as well
>fix the bug, and the applications that relied on the bugs should be
>patched/recompiled. You tell me what is the best approach.

How could I possible tell you? I'm not a coder... and just for once try to see it from my viewpoint: as the user. Being a coder yourself it's quite normal you view it from a coders perspective...

As a user I can use three OS's on this platform, and as long as some general rules are used they are compatible with each other. This must be unique!! I don't think there's another platform out there where the same applies.
To answer the question: ofcourse the best approach is the one you suggests, but then you must also accept that some apps which aren't developed anymore and are not GPL, simply won't run anymore. Take the TMS Cranach package for example, there's no alternative for it because it has some unique features which aren't found in the other graphic apps... so what do I the user do? And even if there's an upgrade path... if one has to update the whole lot which for one reason or another doesn't run like it should under MagiC or MiNT, then it will costs a small fortune. So what on earth is so difficult to agree on when I suggest to keep on using the stuff which doesn't run well under MiNT? It's only a matter of switching from one OS to another, XBoot is just perfect for this. Following this method the user can update when he wants/needs/can afford to and still reap the benefits of using MiNT. Even if he hasn't got MagiC, well then there's still good old TOS waiting to come to the rescue...

>>sorry that it never reached your part of the woods, if it would have. Then
>>surely Eric would have had a good look at the MagiX's internal, and bam,
>>same features.
>
>hmmm magic, last time I checked was closed source.

Anyone can get help/advice/coorporation from the author. AFAIK it's always been like that. The main problem ofcourse is that it's much easier to blame Magic for it's commercial status... commercial doesn't necessarily have to mean closed. And in MagiC's case it definitely isn't so.
Not to mention that one can apply some creative "reverse engineering", that's something new I've learned from this thread, who said these threads serve no purpose at all ?

Cheers from Belgium

5227. Re: Falcon: JagPad util for Joystick

Newsgroup: comp.sys.atari.st
Date: 2003-08-03 09:32:16 UTC
From: Tom McEwan <captaininsanity@ONAYAMSPAYuk2.co.uk>
Message-ID: <bgikrk$8o8$1@newsg1.svr.pol.co.uk>
Source record: 24906

You could try building a controller, if you can't find one for sale (best advantage is, if you can get hold of them, you can use arcade machine joysticks and buttons, making your own controller much more robust and reliable than a second-hand pad, which may well have some buttons worn out, and also won't have that Holy arcade control "chunkiness" that some gamers seem to treat the same way as a biker treats a Harley).

There are several schematics out there, though some have mistakes, so I recommend finding at least two and comparing them. The biggest problem with building them is the connector - the port on the computer is designed for those stupid moulded plugs, so a regular PC sized plug with locking screws won't fit without filing a bigger hole in the case, which will probably make the machine less valuable to a collector, if you ever decide to sell it.

5229. [ANN] Cresus beta 5

Newsgroup: comp.sys.atari.st
Date: 2003-08-03 15:40:30 UTC
From: ptonthatNO@SPAMclub-internet.fr
Message-ID: <3f2d2cec$0$9623$7a628cd7@news.club-internet.fr>
Source record: 24907

Bonjour :)

Download on my homepage http://rajah.atari.org or directly at
http://membres.lycos.fr/nef/files/ -> cresusb5_uk.zip (~130 Ko)

If you use Cresus, make a backup before
If you do not know Cresus, it's a banks accounts manager.

New in the beta5 version:
- bugfixes:
- cents amount approximation.
- bad display if date transaction was modified.
- etc.
+ left space in popups.
+ English translation fixes and help by Derryck CROKER
+ TT-RAM used if present.
+ editable fields for date can use the format for display.
+ date reverse order display for transactions (need relaunch of the
program).
+ possible automatic save of the configuration when leaving.
+ if transaction is a transfer account, the amount is written in the
target account (carefull, writes are not linked, so delete of a
transaction deletes NOT the one in the target account).
+ popup menu in transaction window: quick delete, check or uncheck
enabled correlated with the (multi)selection of transactions.
+ transaction search functionnality (on the opened account)
+ jobs: automatic transactions

Forgot in the text file, but present in this release:
+ auto incrementation of check number (from last transaction with check)
+ calendar (double-clic on date field)

Greetings and thanks to:
- Olivier VANONI
- Cyril 'Bibou' LEFEBVRE
- Jean-Marc STOCKLAUSEN
- Derryck CROKER

Hope you'll be satisfied by our work :)

He does not have to. HDDriver uses the SCSIDRV interface, so if you or
someone else writes a SCSIDRV-compatible low-level driver for the IDE port,
then no modifications to HDDriver should be necessary.

U assume too much... as usual. MiNT is not stoped if u run task in background. Fact, not assuming, is that for example, i can run file system check on ext2 partition in background, and meanwhile GEM runs happily, even can acces same partition which is checked... Of course there is a slowdown, but small one. Run Diamond edge in Magic and tell me how responsive OS will be...

> So, the OS used does make a difference.

Yes it does... And in such comparision, its fair MiNT can use ext2 or minix partitions etc... Or MiNt should be banned to use its strong points? And since both are mtasking OSes, which main goal is not to sit and wait till encodig is finished, its wise to run some other processes while encoder is working..

Now you're forgetting one *very* important thing here: Although background
DMA will allow *the rest of the system* to continue working, the process
that writes to disk is still blocked. And on a Falcon with CT60 background
DMA won't make much difference anyway, since the CPU has to move
everything from fastram to ST-RAM before the DMA transfer can take
place. And this will only work on SCSI disks. And SCSI on the Falcon is
slow.

Sorry I can't answer your question but I have one of my own to ask :)
Anyone know if a JagPad will work in a game that requires only a one
button joystick? To clarify, I don't mean hardware interchangeability but
only functionality in the game not reqiuiring a JagPad).

Hi Clint, only a fortnight ago I suffered with a hard drive problem.

When I copied something from 1 drive to another I would get (eg.) a folder with ten item equaling a meg, would become a folder with say, 3 items, equalling a meg.

When I then tried to delete these newly (incorrectly) copied files, I couldn't. I was able to delete some, but not all, and at least the master folder would be undeletable.

I had four partitions on the TT's hard drive, running diamond edge told me that the E: partition had bad sectors on it, and I'm assuming this was the problem. In the end I scrapped the drive and got two 1gig scsi drives off ebay for 99p

If you have and can run diamond edge, do so, you may find the problem... Rob

It won't, the jagpad is 180 degree's different in every respect.I did see an analog to digital adaptor which will allow a jagpad to be used in place of a conventional joystick. I think it was either b&c or best in the US.

The end result is NOT going to be the same.
Recompiling a 060 kernel and patching a 68000 kernel to be 060 friendly is
COMPLETELY different.
If you don't understand this, this is hopeless.

Even those do not have to be reformatted. As long as a medium is not
corrupted partitioning is always sufficient.

That's how I ordered N.AES, but well that's a while ago, dunno how it is
now.

> It's because we're talking about a newbie here, someone who still has to
> learn the ins and outs of MiNT, dropping him straight into MiNTNet would
> be fatal. And yes I think it's lots easier to enter your parameters in an
> easy to use setup program.

Again you obviously have no idea of the current state of MiNT(net). It
has an install program that just asks you for the parameters.

> And if you think that's crap just look it up in
> Google: there must be hundred of posts about people having a problem with
> even getting something relatively simple like STiNG set up correctly.

STiNG is definitely not "relatively simple". It's GUI-over-the-top, a
tanglewood of dialogboxes where especially newbie users will easily get
lost. It's also living proof that GUI's don't automatically make
configuration easy.

> You
> won't find many Iconnect related posts, not because there is hardly anyone
> using it, but because it's been made so damned easy...

Or MiNTnet related posts, except those dating from before the install
program, or discussing more advanced topics.

> Some people here did say it was 100% compatible, but if someone says that
> *any* GEM app runs perfect under MiNT,

Well they are lying. :) But programs designed according to the GEM
standard will work under MiNT/N.AES, and not necessarily under MagiC. I
guess that's what they mean. Just wrongly put.

> Ofcourse it isn't.... all one needs to do it take the source and run it
> through a compiler, at least that's what I've been told and learned from
> this thread .

I'm not saying it's always that easy. I'm saying that once someone with
enough experience has done it and dealt with the small incompatibility
problems that might occur, you can simply download pptp.xif and put it

in your mint folder.

> Have you any idea how many times I've heard someone singing
> that particular song? "it's not difficult to port", "we only have to port
> it" etc.... and then you and some others here are amazed why I make such a
> noise?

Yes, because every time something IS ported, you ignore it because
according to you, ported open source software is not interesting for
Atari users. So you like to make it seem that nothing is ported.

http://sparemint.atariforge.net/sparemint/html/packages.html

>>By the way, when is the iConnect driver for DSL coming?
>
> Unless someone happens to port a DSL driver one of these days, I wanna
> make a little bet with you:

Unless someone ports a driver? Well I'd be happy to join you in that bet
unless someone makes a driver for iConnect. :) Maybe I'll try and port
the driver myself.. not that I need it because I use a linux firewall,
but I'm still looking for a nice project to get into development on the
Atari. Despite being an Atari freak, all dev I did so far was on Suns,
PCs and embedded stuff. So it's about time to change that. :) Right now
I'm doubting between porting pptp or writing an XFS driver to access the
filesystem on my S55 phone. But that last plan is a bit difficult
because I can't find the right documentation for the S55.

> that driver will be here before the second
> quarter of 2004... there's more in the pipeline then you think.
> So what about it? If I loose I'll send you a six pack "Duvel's", and if
> you happen to loose, you send me a six pack "Amstel Gold"... :-)

Ewwwww! Can't imagine someone from Belgium of all places asking for
Amstel beer... :) But this looks like a bet with inside information. I
don't like that. :) If I do find the time to get started on pptp for
MiNT anytime soon, we could bet which driver is ready first. At least
that way there would be an element of competition. :)

Although first of all I'll ask around on the MiNT list if anybody else
is already working on it, because like I said, I know someone already
mentioned starting this.

Anyway, all things keep pointing to the same conclusion: Both systems
have their advantages and their drawbacks. My only fundamental
disagreement with you, apart from my personal preference, is that it's
not a good thing to try and convert the whole Atari world to Magic or
ignore MiNT as a serious platform. The huge number itself of people that
feel offended by you, whether they are right or wrong, should prove that.

Basically, we have the same choices as on the PC; one OS integrated in
it's GUI that is easy to use as long as you don't want to do anything
special (Windoze), and one Unix-based OS with separate GUI that is more

reliable and is Unix compatible, and consequently has more advanced uses (Linux). But in the Atari world, these two systems are actually compatible! Enjoy it man.. Atari rules! :)

Maurits.

I wasn't talking about that at all. I was talking about your advocacy
that future developments should be for Magic alone.

> For one reason or another these programmers luckily aren't narrow minded
> and do their very best to make sure that their creations run on all three
> OS's...

Which is good, although I've seen you state a couple of times that you'd
rather not have them waste their energy on this and just develop for Magic.

Ah, Mandrake also does Mac? Hmm might be worth taking a look, although I
prefer running Linux on PCs only; the Mac (since os X) as well as the
Atari have too much "personality" of their own to replace it with
Linux.. just turns them into expensive PCs. :) But since my refusal to
buy a PC (I'm just using discarded 486'es and stuff), it would be nice
to play with a powerful Linux station for a change. :)

Correct. Reverse engineering is looking at what something does and then
making it yourself, without looking at the original's sourcecodes.

Whoops, I just described MagiC! ;)

You keep twisting all the facts in your direction right? :) MagiC has a
developer, MiNT has developers. They're both developing, or - if you
want to put it that way - fucking around with it.

> MagiC is fine as it is, people using it, have made a choice, and they are

You could really just have this discussion with yourself. Just replace
the words "Magic" and "MiNT" in your own posts and then reply to them.
:) Because the above is sorta what me and others are trying to tell you
about MiNT.

>>That is, once we explain to people that sticking MINT.PRG in the

Yes, well, the AES and the Desktop (who has to tell the AES to install a new ACC). I think even Atari AES 4.x supported this btw.

> Also not all acc's unload, but most seem to.

Depends again on how cleanly they are programmed. :) Pre-Multitos ACCs didn't realize that they could be killed so they might get stuck.

Rob,

Yea.... I was wondering the same thing.. I have 4 partitions as
well...

Ah... I just won a 3GB on eBay for it so that should work out well, I
only had a 65mb on my
current setup anyways so it needed it! :)

Thanks..

Clint

Well apart from that, you can't port drivers because they work
completely different on each operating system; you could use some
sources as examples at the most. But XIF/XDD/XFS have quite a different
interfaces from Linux kernel modules.

> So u cant get them and compile them. Next, there

Well in the case of the S55 driver, it should simply use the special AT
commands that fetch and send files to the S55, but I'm still looking for
the documentation. I know it exists somewhere..

I have some suggested changes for the resource file for you which I will forward to you when I've had a chance.

> New in the beta5 version:

Will it be possible to print via NVDI or GDOS in a future version?

This is a nice program :-)

Do not use it very much, but getting a B-size Roland plotter may change
that. New toy to play with. The drafting program is Dynacad.

Jim
waldo <waldo_xx@yahoo.com> writes:

I think ppl here dont understand (or know) one fact: in most cases u cant
port drivers for gfx cards, scsi ethernet devices etc from one simple fact:
they arent open source. So u cant get them and compile them. Next, there
also is no specifiacations and HW documentation, so u cant write them from
scratch... Things like unix sockets, pppd, imap etc are open source and
MiNt has most of them ported. No Unix platform, GCC or anything can help u,
if there is no hardware specs.. Or sources.

> If you don't understand this, this is hopeless.

MagiC for the Falcon can work on 68000 to the 68040 but only the boot
like the TOS 4.04 is compiled for the 030.
There are just some patchs for MagiC :
- Fix the 68060 detection (cookie).
- Fix the vectors for not overwrite the Floating Point Software Package
and unimplemented Instruction Software Package in TOS flash.
- Fix the DSP subroutines (too fast for the 060), like the TOS you need
to test the handshake.
- Remove the init of the 030 PMMU.
- Remove the movep instructions for not call th ISP.

If you know the list of the 030 patchs for the TOS 4.04 it's totally
different, there are just some minors patchs for MagiC.
And it's the same version for the 030 and the 030, only the boot is
changed.

Regards,

Didier.

From: xlator@cix.compulink.co.uk
Message-ID: <bgm67pero1@thorium.cix.co.uk>
Source record: 24934

Hi!

My wife has some health problems and finds it difficult at times to double-click fast enough on her 4 MB STFM for it to be recognized as a double-click. She is using he General CPX with the mouse d-c speed set to slowest, but it still isn't slow enough.

Is there a CPX or ACC that can be auto-loaded at boot-up that allows either setting the d-c interval even longer, or - better - to allow using the right button for double-clicking in all programs, including 1st Word Plus? (I know it's out of date, but she is used to it and it does all she needs). I can do the latter on my Falcon under MagiC and Thing, but she is running TOS 1.04 wih the Aari desktop; this is quite sufficient for what she uses the machine for :-)

Regards, /Peter/

Hi all

Due to Yahoo groups re-organization, I have completly vamped my site

Tim's Atari Midi World : http://tamw.atari-users.net

There is now easy to use navagation on each page and a more
proffesional look (IMHO) Each page was checked for all the links. I
had to download all the files on the Yahoo groups file sections,
upload and create links to them from the appropriate pages. Been
working all weekend on this and is now (pretty much) completed. I
also created a new page called "articles" which has links to all my
articles on MyAtari.net.

My "download" page I still have to work on, as there are links to some
files from the yahoo pages. I might take it off for now.

If you find any links that do not work, please let me know. I hope you
like the new look.

BTW: if you have gone to my site before, you might need to "refresh"
the page so it will load the new stuff:-)

Well, there is nothing new under the sun.
In 1968 I started working on a computer that was able to do what
Dennis describes.
Each process was able to intitate a peripheral transfer, get a direct
response and than issue a wait command for the transfer to be completed.
This made it possible to process a block while the transfer of the next
block was in progress. If the process time was below the transfer time,
peripherals could be driven at their maximum speed. Anytime, the process
and transfer times were completely overlapped.

Should really not be too difficult to implement in a modern OS.
Or is it already? I dont know enough about Unix.

I'd much rather send the following to an interested user than throw it
away. All of it was in working order when I boxed it, with the
exception of the SF 354 disk drive, which may be repairable. Make an
offer; minimum bid is $1. You pay any shipping charges from Denver,
but I won't ask for any money for my time and trouble.

520 ST computer
SM 124 b&w monitor
SF 354 disk drive
Master 2S disk drive
original boxes and owner manuals for all the above
Atari language and 1st word disks
metal stand for the computer, drives, & monitor

The following printer is offered separately:

Epson DX 20 daisy wheel printer, with tractor drive, 3 ribbons and 4
extra wheels including both 10 and 12 characters per inch.

Gil Humphrey

Then you must have missed something. There is no special low-level
format for the Mac or any other platform. The only difference are the
file systems on the drive, which are created when partitioning.
Partitioning will effectively overwrite the old file system structure,
regardless of the platform it was created by.
Anyway, formatting does not harm, of course :-). Just takes time one can
better spend with other things.

The AT-command set yes, but not in the Hayes Standard set, more likely
one of the extended sets (and probably the Siemens set).

I don't know about changing the mouse buttons, but you can adjust the
doubleclick speed even in the ancient standard control panel that came
with the ST, and Xcontrol and Zcontrol also come with a CPX to do this.

Maurits.

In other words, open source or death. :)

Funny how in "some other threads" here, MagiC being locked away in the dungeons of Andreas Kromke is a good thing, and an active team of MiNT developers (nicely controlled by CVS and a kernel coordinator) is described as "people screwing around with it" which is a bad thing. Besides, MiNT sucks as an os because there are no new developments (well there are, but they are not interesting for Atari users, well except the MiNT users but they are silly and don't count), whereas MagiC rules because it works with old software so you don't have to buy new developments, even if there were. Which is good. Because paying for new software sucks. Except when it's MagiC. Erm.. I'm getting confused now.

This stuff is more complicated than installing KGMD :)

Maurits.

5267. I now have a Falcon030

So what should I do with it? ;^) I've had it for a few weeks now, and have mostly just been playing a few Reservoir Gods games with it (I'm now an official Superfly addict!) as well as tested out a few of my old ST apps. However, I've been out of the Atari ST/TT/Falcon scene for about 6 or 7 years now, and I have no idea what the latest MiNT/MagiC/etc versions are, as well as what would be the best OS to run on it. Good old single-tasking TOS has always served me well, but I'd like to get into some multitasking action, involving the most TOS-compatible OS possible, and even try my hand at some more "modern" things, like getting online with it. Can anyone out there give me some advice?

Tim

Yes, for example every piece of software that tries to have somewhat the
same user interface as competing software. Basically, including a "Save
file" option in your program that can be accessed with <CTRL>-S is
reverse engeneering and hence stealing. Surely you didn't think of the
idea of using ctrl+s yourself?

Maurits.

MiNT? 1.15.12, or 1.16.0 beta. EasyMiNT has a very nice installer program, and if I run into problems, the mint-list mail group has been very helpful.

This is being typed into a TosWin window under MiNT, and I find it quite useful. The old, perhaps ancient, ftp and telnet programs work perfectly, and that is mostly what I use it for. I do have STiNG and its clients, but do not use them any more.

For the latest in MagiC, you might look at the Europe Shareware web site, since I just got e-mail mentioning it, in partly understandable Frence.

Jim

Well depends on how much RAM and HDD space u have.. Especialy RAM is
tricky... I wouldnt recomend u even think on MiNT if u dont have atleast
14MB, and even in that case it may become tight, if u will boot in full
MiNT setup (unix) and also load AES.. ull end up with some 6-7MB free RAM.
less if more fancy things.. Magic use a lot less resources so except if u
really want Unix, go with Magic... But since there is xboot ot othet boot
managers, u can install MiNt and Magic, and boot into prefered system as u
wish...

Congratulations ;-)))

I am in the same situation as you are, but have no Atari-experience at all.
I intend to use it/him for programming purposes (and gaming). There are some
nice demos at http://dhs.nu

Bye

Hey this looks as if I posted this! I am in the same boat as you. I did
install a nice 8G HD in mine and have been trying all sorts of ST software,
most do not work. But that is not surprising as the Falcon is a lot
different than the ST series, just looks the same on the outside! Totally
different beast inside.

So I have also tried a few Reservoir Gods games loaded! Double Bobble 2000
is awesome! My favorite game at the moment. Real nice version. I wish
there were some descent emulators for it like SNES or Atari 800. That run
full speed anyway. I recently got a Atari 800 emulator but have not played
with it much yet. Heard it is slow on the 030.

I am quite disappointed in the lack of software for the Falcon. Especially
shareware. I came from the Amiga as was quite spoiled from Aminet I guess!
;)

But be aware that DE has problems with large partitions and also LFNs. On my 6.4GB disk with 840 MB partitions I get nonsense such as negative numbers for capacity, so I wouldn't trust it for repairs or defragging such disks. A 1GB subdivided sufficiently small partitions may be OK, but HP Optimizer (PD) is a much better bet, you'll find!

For online use there is a wealth of options. From STiK2 or STiNG if you
want an
option that isn't OS specific to MagicNet or MiNT Net if you are going for
one of these 2 OS options. There is also the option of Draconis that has
been having alot of updates recently. Beyond these there are still several
other
players out there in the market.

There is a program called Backwards, which is available on the net. It will
allow alot of older programs to run properly on the falcon.

There are quite a few toys and games linked at http://www.gemcandy.org
(shameless
plug), which I've just gone done doing a major house cleaning on and fixing
alot of links.
Probably not many things to compare with a Resevoir God game, but many
interesting
distractions are available.

If you want to play with Falcon specific, there are still a number of
older things available
at http://www.umich.edu/~archive/atari/Falcon/

Have fun. With a bit of digging around you should find enough stuff to keep
you busy for
weeks.

That said, you *can* have an extremely basic Mint setup with just the
Mint kernal (MINTNP.PRG) placed in your AUTO folder, a MINT folder
with a MINT.CNF file that contains a GEM= or INIT= followed by the
path to an AES (AES 4, NAES, Geneva, XaAES, etc.).

Several people have offered to give me pirate versions of magic for
development use. I suppose that is acceptable stealing if it benefits
magic. However,I refused all such offers.

Hi Tim,
There's always a large debate between Magic and Mint users but I feel safer with single TOS 4.04.
Someone here stated that the Falcon is a "Audio" machine that just happens to also be a computer! I use Cubase for direct to hard drive recording & MIDI (I believe Cubase Lite is free) and there's other recording software and hardware attacments that expand it's cabability but I've found it's pretty powerful alone. With today's large files a speeder-upper hardware enhancer is pretty much necessary (mine is Phanton SE powered and a number of others are in use but most are no longer in production.....see the CT60 for the latest)!
Aniplay is a nice multi format player. Doom is a massive game (my favorite) along with Ballerburg2 (now being translated to english). Some ST games are playable with Backward III such as the F16 Flight Simulator but note that a "vanilla" set-up might be needed so that Auto folder programs don't interfere with some games.
For the NET, STIK/QDIALER is one way to go. It's easier to set up than Sting but the latter has on-line tools (such as Trace Route). CAB seems to be the most popular browser and Highwire is in devlopement.
A good source of FTP files is Chapelie (someone will give the address :)

Enjoy!

John G.

well part of the reason I posted that was because of my own interest in
the future of MagiC.. I mean hey I own 3 copies including the latest
version but surely I don't deserve anymore updates. Considering I own not
a single copy of windows ;) I guess they just have a better marketing
team, that's all.

Anyway, the other reason I posted to usenet was exactly that. To settle
Dennis's dead assertion that MagiC has a brilliant future in the Atari
world. Unfortunately, and I say UNFORTUNATELY it doesn't. In a prior
argument with me, I remember him using that as ammo against me, that MagiC
will be having more updates. False....

Not to add any flames to the subject, but I recently have done
something I never thought I would do as a frequent MagiC user. I
went back to using Geneva/Neodesk primarily. I have found that it is
the most stable environment for most of the software that I use every
day. Especially for "Newsie." For some reason it is much faster,
and I don't have the problems I sometimes experience with MagiC.

5286. ct60 and NOVA

Newsgroup: comp.sys.atari.st
Date: 2003-08-06 08:23:06 UTC
From: f.szymanski@dmt.de
Message-ID: <674c5603.0308060023.6254e66c@posting.google.com>
Source record: 24818

Hello,

I recently received my ct60, installed it and its running fine. :-)

Unfortunately for my first tests I had to remove my NOVA graphics card. Even though the ct60 is faster compared to the afterburner card that was installed in my Falcon before the slow and small graphics from the VIDEL drives me crazy.

So I installed some connectors on top of the NOVA adaptor to install the NOVA between the mainboard and the ct60 but there is one scary thing that prevents me from installing it.

The NOVA adaptor needs +12V and -12V from the mainboard.

Does anybody know whether it is still necessary to connect the two clips on the NOVA to the mainboard or is +/- 12V provided by the ct60 now.

Thanks in advance,

Regards,

Frank

Hi Ekkehard,

>DV>I never tried it under MagiC, but then why would I? There a no rpm
>DV>packages available that will run under MagiC
>
>There aren't? I doubt that. I've got both MagiC and MiNT installed here, and
>thus can install RPMs under MiNT.
>There are programs available, that do run (and are useful) under MagiC, but are
>available only in RPM form.

Let's presume that I would download them from a ftp server or from the SpareMINT website for example: there is no indication which of these packages might run under MagiC. So, I either wait until someone happens to mention them in here and tell us that they actually run or download the whole lot and waste a day trying them out. Sorry Ekkehard, but both these options aren't very appealing. If MiNT developers/maintainers/porters can't be bothered mentioning which programs happen to run under MagiC or even TOS also, then why would I?

>Examples:
>- wget (command line http and ftp download utility). Works great with MagiCNet,
>but has some small display problem (cr/lf vs. cr only).

Here we go.... you just said "that are usefull", these two examples may be very usefull to you, but that doesn't mean they are usefull to everyone. There are people here who don't like to work with CLI's, I happen to be one of them, and according to Lonny, I should stick with kid stuff anyway...

wget is one of the apps which I would never use, whenever I need to download or upload anything from a ftp server I use Fiffi, and before anyone makes silly comments, so far I haven't encountered one ftp site which couldn't be accessed or needed a more sophisticated client. If I need to download stuff from different maps in different trees, then there's the drag &drop protocol helping me to make it easy and for complicated tasks there's always a ASH Scripter file available to come to rescue... as for features: well just compare and judge for yourself. And for http there's the CAB surf module.

>- dosfsck (FAT16/FAT32 directory/file structure test and repair program). The
>only available for TOS systems!

Dosfsck is not the only program available for TOS systems that can handle FAT32. Take a look in your mailbox and be surprised, Oh and surely you'll notice that instead of once again a silly CLI this one has a nice graphical interface. You may like or dislike such an interface, but IMO programs like these need to give feedback to the user, and nothing beats graphical feedback for this kind of apps.

Anyway, as it is dosfsck lacks the option to optimise a FAT32 partition, you may find this not necessary, but I do.

So to conclude: minimum two similar apps already exist for our platform, they both have a full featured gui and on top of that have much more features. And considering that the apps are freeware as well, I see no reason to use the two open source ported CLI's... And yes I know that these were just two examples of the "mountain" of stuff that's available, unfortunately most of that mountain consists of stuff like these two examples. Using an app just for the sake of it is something I don't do. Apps like wget are not going to save this platform, they just add to the ever growing mountain of internet clients, as for dosfsck, I very much doubt that there are a lot of people here who would jump up and start using it... not the way it's now anyway. Last year Grzegorz Pawlik wrote a Scripter file for it, that script gives it a minimal user interface.... but IMO not good enough...

Cheers from Belgium
Dennis

Hi Jo Even,

>N.AES implements most (all?) special objects introduced in MagiC, the only
>real difference is the way 3D borders are drawn. N.AES does it like Atari
>Corp. did. MagiC doesn't. From a programmer's point of view I prefer the
>first.

N.AES draws the borders outside the object and this has the effect that the objects total size enlarges. MagiC on the other hand draws the borders inside the object, thus retaining the original size. In the MagiC programmers docs, Andreas Kromke goes through great lengths explaining why he choose to implement it this way, when reading all the pro's and cons, the MagiC approach makes more sense to me. Not to mention that it's visually more appealing also ofcourse, especially in low resolutions these 3D borders drawn outside the object don't look very good.

Cheers from Belgium

Yes, it has arrived! Thank you, Rudolphe! You ARE the man! Haven't even tried to install it yet, just collecting the things I'll need to recase it. Not gonna hurry, I'm too ignorant technically to rush it. Just ask Rudolphe, he had to fix my bad installation of my CT2B! ;-)

Myself have used it some time but found it rather unstable on the TT030.
I've tried it to make it running on the Hades using kernel 1.15.12 but
this test failed for some reason.
However years ago a friend of mine has used MiNT 1.12/MiNT-net/Geneva on
his TT030 during a long periode. He was very pleased with it.

CU,
Martin

Hi Maurits!

As I said in my first (non-quoted) para, I am already using
Xcontrol and relevant CPX from Atari. I was wondering whether
other CPXs allowed a wider latitude - i.e. longer intervals.

Regards, /Peter/

I have 8.9 Mb free of 12 Mb on my TT
This is
freemint 1.15.12 + MP (page tables!!!)
XaAES
Teradesk
Toswin2
Xcontrl + 6 cpx
Nova VDI

PS Standa:
Your proof would be totally convincing if you also
showed XaAES's task manager window. (XaAES only runs with MiNT)
;-)

My MagiC 6 comparable setup leaves 10.3 Mb
This is
MagiC 6 (which is kernel & AES)
Teradesk
Xcontrl + 8 cpx
Nova VDI

>>be fatal. And yes I think it's lots easier to enter your parameters in an
>>easy to use setup program.
>
>Again you obviously have no idea of the current state of MiNT(net). It
>*has* an install program that just asks you for the parameters.

I know it has, so what? These parameters will be an enormous stumble block
for that newbie... you seem to forget that the docs are not so clear as they
could be. Someone new to all this having to wade his way thorugh the giant
mess the MiNT docs have turned into will run away screaming out loud.

>>Have you any idea how many times I've heard someone singing
>>that particular song? "it's not difficult to port", "we only have to port
>>it" etc.... and then you and some others here are amazed why I make such a
>>noise?
>
>Yes, because every time something IS ported, you ignore it because
>according to you, ported open source software is not interesting for
>Atari users. So you like to make it seem that nothing is ported.

I said for the *majority* of Atari users, and that is a complete different
group.
Let's take three examples which have been recently discussed here, three
examples which were ment to show me that this sofware is interesting for
Atari users:

Ghostscript: unless one happens to have a 060 processor in his computer, this
port is rather useless. I assume it's ported by someone who needed it and had
a Milan or Hades060... people needing to read ps files are better of with the
ancient Ghostscript and people wanting to read pdf files are definitely
adviced to take a look at Porthos.

fsdsk and wget: I refer you to my other post for this, but let's just say
that this type of software doesn't impress me. Sure, the people that ported
it did their best, but is this really what we're all waiting for? Sorry but I
don't get wild about stuff like that. Especially considering that we already
have apps which perform similar tasks.
There's so much missing on this platform, and then all I see coming are some
more net-related ports, which to make matters worse are CLI's and in many

cases only run on one of the three major used OS's. So yes, I ignore these ports.... not because they are CLI's or OS specific but mainly because they add nothing to this platform. If tomorrow someone here announces a new mailer or ftp client which happens to run on all three OS's, I'll ignore it as well. The wheel has been invented....

>Despite being an Atari freak, all dev I did so far was on Suns,
>PCs and embedded stuff. So it's about time to change that. :)

Yes it is :-)
There's enough stuff for those two platforms available, it's time to turn and look in the other drection.

>> that driver will be here before the second
>> quarter of 2004... there's more in the pipeline then you think.
>> So what about it? If I loose I'll send you a six pack "Duvel's", and if
>> you happen to loose, you send me a six pack "Amstel Gold"... :-)
>
>Ewwwww! Can't imagine someone from Belgium of all places asking for
>Amstel beer... :)

Well... The Heineken "kattenpis" is out, so it was either Amstel Gold or Grolsch...

>But this looks like a bet with inside information.
>I don't like that. :) If I do find the time to get started on pptp for
>MiNT anytime soon, we could bet which driver is ready first. At least
>that way there would be an element of competition. :)

Ofcourse I have a little information, betting is a serious business and should be approached seriously ;-)
But it's not like the stakes are sky high... however betting on what driver would be finished first is definitely not a good idea, unless you wanna send a sixpack beer to Belgium ofcourse (that's a hint...)

>Anyway, all things keep pointing to the same conclusion: Both systems
>have their advantages and their drawbacks. My only fundamental
>disagreement with you, apart from my personal preference, is that it's
>not a good thing to try and convert the whole Atari world to Magic or
>ignore MiNT as a serious platform. The huge number itself of people that
>feel offended by you, whether they are right or wrong, should prove that.

Maurits, it's summer... Every summer we have a good fashioned OS-War flaming thread, it's traditional, and particularly this year it was a necessity. It may have gone unnoticed, but ever since I started this pointless discussion the fagboy Benny and the Luposian threads came to an end. Threads like these hurt this platform and community, a OS discussion doesn't. I'm convinced that a lot of people who haven't joined the discussion have learned at least a couple of things from it. If you call the small number of posters which opposed and feel offended by my views "huge" then this says enough about the state this platform is in. And to be honest: I don't really care about these people their feelings, they've shown in the past not to respect others their feelings either. A couple of posters will oppose whatever I write, seeing my

name is enough to set them off...

>Basically, we have the same choices as on the PC; one OS integrated in
>it's GUI that is easy to use as long as you don't want to do anything
>special (Windoze), and one Unix-based OS with separate GUI that is more
>reliable and is Unix compatible, and consequently has more advanced uses
>(Linux). But in the Atari world, these two systems are actually
>compatible! Enjoy it man.. Atari rules! :)

I am enjoying it, and I want to enjoy it for many more years to come. This platform is very small now, the comparisation with the PC platform doesn't take that in account. We can't afford to have two OS's that are incompatible, just like we can't afford to have apps that only run on one OS... If we have to split up the little that remains... then there won't be nothing left in the end. Surely, that's something nobody here wants?

Cheers from Belgium
Dennis

>And take another look at Lonny's english. You have been talking about
>stealing, making remarks about Hades and someones mother. So, yes, you did
>make those statements... however, do you still support them?

Oh boy!!!!
Another one using Pine... why is that people who use this program always
get to see and read more then what actually has been written? If it's not
yuur newsreader then one can only presume that you're hallucinating, in
that case you should go and see a doctor *urgently*

But OK, fine....
Show us or post the reference number of the post(s) where I make remarks
about someones mother, about *Lonny* his Hades and about stealing. I put
it to you that just like Lonny, you won't come up with the goods.... I
never made any of these statements nor did I support them, so there's no
reason for me to retract anything either... how's that for a start?

BTW: use a better newsreader, the one you're using obviously sucks.

Cheers from Belgium

Hi Maurits,

>>Did you say "our" developments? Sorry but taking a source and running it
>>through a compiler doesn't really qualify as a developement, and the few
>>remaining *real* programmers just happen to create something from scratch.
>
>I wasn't talking about that at all. I was talking about your advocacy
>that future developments should be for Magic alone.

That is absolutely not what I'm advocating!!
All I want to see are apps that run on the three OS's, a OS specific - no
matter what OS - appliaction, is the last thing on my mind.

>>For one reason or another these programmers luckily aren't narrow minded
>>and do their very best to make sure that their creations run on all three
>>OS's...
>
>Which is good, although I've seen you state a couple of times that you'd
>rather not have them waste their energy on this and just develop for Magic.

I'm pretty sure I never ever wrote anything in that order. So you either
misinterpreted it or that newsreader is playing up again. I know a couple of
programmers who think getting it right for anything else then TOS and MagiC
is a waste of time... but that doesn't mean that I share that view. But I do
care if someone spends energy on something, comes in here telling us about
that great Atari app and then it turns out to run only in one of the three
major used OS's... call it nitpicking if you like, but an app like that
doesn't deserve the name Atari app in my book.

>Ah, Mandrake also does Mac? Hmm might be worth taking a look, although I
>prefer running Linux on PCs only; the Mac (since os X) as well as the
>Atari have too much "personality" of their own to replace it with
>Linux.. just turns them into expensive PCs. :) But since my refusal to
>buy a PC (I'm just using discarded 486'es and stuff), it would be nice
>to play with a powerful Linux station for a change. :)

I was surprised also about Mandrake, the Mandrake compilation is a 3 CD set,
a nice one to start with however is GNU darwin 2.3, that's OS X without the
"ballast"

Cheers from Belgium

Hi Mark,

>Anyway, the other reason I posted to usenet was exactly that. To settle
>Dennis's dead assertion that MagiC has a brilliant future in the Atari
>world. Unfortunately, and I say UNFORTUNATELY it doesn't. In a prior
>argument with me, I remember him using that as ammo against me, that MagiC
>will be having more updates. False....

Let's take another look at Oliver's reply:

There's a quite a difference between the replies given to question 1 and
question 2. When asked if the sources of MagiC could be released, he replies
with a straightforward "NO", the reply about the future update of MagiC-Atari
however isn't so straightforward, a "I don't think so"... is not exactly the
same as "no".

Instead of getting in touch with the German distributor, get in touch with
the programmer himself, I presume he at least knows the score? Has it ever
occured to you that ASH won't be releasing any future versions of MagiC for
the Atari anymore because of sales that are too low? Andreas Kromke follows
this group.... have you seen anything coming from him denying it? All I can
say is that development of MagiC is not dead yet. And unless the programmer
says so himself, I tend to believe him...

And then you can come in here and cry victory....

Cheers from Belgium
Dennis

Date: 31 Jul 2003 14:19:21 -0700

Hi Mike,

>I know this is pretty picky, but that still bugs me. I have some ACC's
>that *have* to be used from the accessory slots in order to be
>available to other programs or to function properly. Because of these,
>my accessories have to be spread out in different locations, rather
>than being able to have them all in one place.

Why do you have to spread the ACC's in different locations? All you need to
do is to create a folder and put all the ACC's in it, next enter the path and
name of that folder in magx.inf. When MagiC boots it'll now where all your
ACC's are located...

e.g: #_ACC C:\ACC\

In combination with an app like XBoot you can select which ACC's need to be
loaded when the OS boots. And since deactivated ACC's (ACX) can still be
started from within Jinnee there shouldn't be a problem.

>I personally don't see
>what the problem is with at least giving the user the option of having
>more than 6 loaded into the slots. Let the user decide whether or not
>to put things there. All other Atari GUI's allow it, why not Magic? I
>hate software that doesn't leave options open to the user's own
>judgement.

Sorry, but I'm not following anymore...
AFAIK non of the Atari TOS versions allow to use and load more then 6 ACC's
at once. When MultiTOS was released, Atari distincted themselves from using
ACC's and adviced using and developing CPX's...
We all have different needs ofcourse, but I can't remember ever needing to
have more then 6 ACC's running at once. Almost al tasks have been taken over
by CPX's anyway, I only have two slots filled, one for XControl and one for
ST-GUIDE. The beauty of the method is that you can run ACC's whenever you
need to, since they are treated as executable apps. In TOS they need to be
loaded when you boot and they use memory as well. In MagiC you load them when
you need them, and if you prefer the TOS way of handling things, you can load
them while MagiC boots, so you've got the best of both worlds ;-)

>Actually, what I'd like to see them do is this: Allow the user place
>the ACC's in a folder, instead of on the root directory (although they
>can be there, too, and function as usual). Put an "Accessory"
>sub-directory on the desk menu, where both the ACC's and the APP's in
>this folder (or even PRG's or anything else, I suppose) can be

>displayed.

As for putting a menu entry in the desktop, that's not an OS-related job.
It's the desktop who needs to be able to accomplish this. But there are a couple of alternatives available: In Jinnee for example you can call up the context menu and select *anything* no matter where or on what partition it's located. You could also use StartMeUp and make a custom template that suits your needs. I use the context menu and select the one I need, all executable apps can be selected, even those that have a ACX or PRX extension... And then there's the "easy" solution, put an alias of the folder that contains all your ACC's on the desktop.

>But that's just me. I like things neat and tidy and easy to get to
>instead of spread out haphazardly all over the place.

Sure... who doesn't?
Keeping it tidy is possible, you can put all your ACC's and CPX's in one location, and if you like to see something like on the mac, then take a look at Mcontrol http://jf.omnis.ch/ , Mcontrol (Milan Control) was ment for the never released Milan II, it's still has the beta status, but most functions are already implemented...

Cheers from Belgium
Dennis

I use Geneva with Mint. It took a little fiddling with, but as far as
I can tell, it is fairly stable on my Falcon. I found when originally
setting it up, it was sometimes fussy with things like AUTO folder
order (more so than AES 4), and there was a program or two that
wouldn't like it, but it was mostly usable. I like the Geneva
environment (very nice for its time), and adding Mint, Thing, and
Boxkite gave it the nice Mint features like long filenames, etc. So it
can be quite usable if you get things set just right. When I switch
from Magic to Mint for certain tasks, or just for fun experimentation,
I pretty much stick to Geneva as an AES.

It's not a victory you lunatic! It's a sad defeat for everyone. I like MagiC. I'm just
tired of it
crashing every time I walk away from the computer for half a day and come
back with nothing running. Machine problem? Funny, MiNT doesn't do that.
So yeah.. I'd like an update. But it's very poor fodder for you to
suggest that there will be updates. You sound as much like a fool pushing
your MagiC is the way of the future BS as you might think I do quoting a
word for word reply that says "No I don't think so". Hrmm.. Seems like a
No answer to me.

Okay. Not sure why it would make your stomach turn. Seems like MagiC
becoming more stable on all platforms would do everyone good. And adding
the option of having MiNT extensions would totally rock and make MiNT not
my system of choice and XaAES not my AES of choice. Unfortunately for
everyone involved, MagiC is still LOADS faster than anything else. Even
if you have a CT60 like I do now, it's STILL noticeable.

> the file.

Wrong. It is Aniplayer that decodes the file, and it is Aniplayer that will be idle. There will be no difference how Aniplayer works on both systems.

It could be described in this way:

Lets split file in n chunks,

Aniplayer decodes 1st chunk
Aniplayer saves 1st chunk

Aniplaer decodes 2nd chunk
Aniplayer saves 2nd chunk

Aniplayer decodes 3rd chunk
Aniplayer saves 3rd chunk

.
.

.

Aniplayer decodes n-th chunk
Aniplayer saves n-th chunk

During saving a chunk Aniplayer can't do anything becouse it is "on hold" by
the OS, no matter if OS is MagiC or FreeMiNT. If Aniplayer would use parrell
peocessing it could be diffrent, but Aniplayer does not do that according to
my knowledge.

>
> So, the OS used does make a difference.

Wrong no. 2

Reading/Writing to disk while running program in parrel is called "DMA
transfers". DMA transfer are usually slow (they are on Falcon) then non-DMA
transfers (when all programs are idle). In some cases DMA
transfer+proccesing by program takes longer then DMA transfer and then
program. It is becouse program and disk transfers (DMA or not does not
matter here) uses the same bus to transfer data. DMA transfers need a bit
more bus speed then non-DMA transfers, so they are slower.

Here's the kicker on that...it's a Bell+Howell Falcon, including their revised serial #'s and such. So, no way I'm getting rid of it! It only came with 4MB RAM and no HD, though, so it obviously needs some upgrading. What kind of mem upgrade would you guys recommend? I already have a 2.5" HD for it, just don't have the IDE cable or mount, which I'll probably order from B&C or Best. Any other suggestions?

Tim

I'm not Mark but I can tell you whet I can see anyway :-)
The 060 is operating at about 4 degrees celsius above the temp of the
room. That is curruntly 32 degrees for the 060, the Falcon being out of
its case, and with the fan fitted. The weather is rather hot here these
days...

Bye,
/Pascal/

My ct60 has an average temperature of 47 degrees centigrade although
it is quite hot here ATM in Germany (~36 degrees).

Hmmm, ambient temp always makes it worse. It is hotter in Germany than
Australia. Been only 16 degrees here. Any other CPU temp's you lucky buggers
want to share?

Mark

Hello Atarians,

Do any of you know a program to convert ico-files (PC format) to rsc-files (Atari). I've tried ICO2RSC but that that work, maybe cause I didn't use enough icons (read something about 64 icons for one rsc).

Second question: if you want to use true type fonts (PC style .ttf) with NVDI where do you have to put them? In the BTFonts folder?

Regards,

Jos

Have a look at Icon Extract:
http://perso.club-internet.fr/lafabrie/

> Second question: if you want to use true type fonts (PC style .ttf) with
> NVDI where do you have to put them? In the BTFonts folder?

In the folder of your choice. Use the cpx to set the location, or edit
nvdi.inf in the root of your boot drive to add a line like this one:

FONTPATH = C:\GEMSYS\FONTES.TTF\

>to allow using the right button for double-clicking in all
>programs, including 1st Word Plus? (I know it's out of date, but
>she is used to it and it does all she needs).

Yep there is....

It's called WRAPMOUS, it's a CPX programmed by Richard Kurz in the early 90's. I'm left handed and thus like using the right button for double-clicking also. This little gem can also drive a PC mouse on the serial ports, let you use a joystick as alternative mouse, controls the d-c intervals and lots more...

It's in your mailbox now... :-)

Cheers from you know where

Once you've sorted out where to stash your fonts use NVDI Tools to manage your fonts; it moves (or copies) fonts to and from a "Hide" folder.

Well that may be true, yet i never sold any atari to earn.. I gave some
to good ppl, since i got them for free, i sold falcon i got for 44E for
same price to pal, who realy wanted it.. I dont realy give a shit for how
much they go at Ebay.. I cant be so low, to offer it at such prize. Also,
on ebay they may GO for that prize, but initial prize is not that high..

Hallo Dennis!

DV>wget is one of the apps which I would never use,

well, and that's where we differ :-)
I use it always when I encounter download problems with Cab. Just copy the URL into the clipboard, change to the CLI window, type "wget " + paste the URL, and wget reliably handles the rest.

DV>Dosfsck is not the only program available for TOS systems that can
DV>handle FAT32.

Which would be the other one? It surely isn't Diskus (which I own), and not yet Diamond Edge.

DV>Take a look in your mailbox and be surprised,

Which one? Please note that my above adress won't handle binaries above 10kB! Anyway, there's no evidence of mail from yours to any of my adresses. Well, this might result from the fact you're using a freemailer adress, which might be filtered somewhere.

Keep an eye on the appearance of the new TeraDesk 3, soon.
Works nicely with Geneva (and other AESses as well...).

>I have found that it is >the most stable environment for most of the
>software that I use every day.... For some reason it is much faster,

Indeed, Geneva is a very reliable option and -very- convenient for
lower-end Atari systems (it is small and fast).

I don't agree with you in this particular case. There are no really good
mailer on our platform. aMail is good, but crashes all the time when
dealing with attachments. Marathon Mail won't even start on my Milan. ASH
Emailer only works under MagiC and isn't really good on that OS
either. MyMail is not bad, but to be honest the GUI is quirky. A new,
stable mailer with just the right features is #1 on my wishlist.

Yes, and so does TOS, MultiTOS and Geneva. MagiC is the exception, I don't
like such exceptions when programming ;-)

> the object, thus retaining the original size. In the MagiC programmers docs,
> Andreas Kromke goes through great lengths explaining why he choose to implement
> it this way, when reading all the pro's and cons, the MagiC approach makes more

I'm sure Andreas considered both methods, I just happen to disagree with
him. Anyway, it wouldn't be a problem at all if programmers who develop
under MagiC just tested their resources with atleast one of the other
AESes (if their application is intended to run on them). But many times,
they don't. This is the problem.

> sense to me. Not to mention that it's visually more appealing also ofcourse,

Ever tried Okami? IMHO, it's the best (off-line)mailer available for our
platform. It runs on every OS (some probs with Geneva though).
It's not that easy to set up but once done it's worth the pain.
It needs Popwatch/Newswatch to retrieve mails/messages and that is the
weak point. Both needs to be updated. Unfortunately the author seems to be
disappeared from earth.

TTFN,
Martin

Hello Pascal,

Thank for the tip. I've installed the program and it seems to be exactly what I'm looking for. However, the program keeps on crashing everytime under MagiC and under single TOS. (Falcon 030)

To be more precise: it stops. No mouse or other reactions. There are no bombs are messages. It just stops working.

Any idea?

Yes, I've used for quite a while actually. Not bad, but not very good
either. Basically, I want something like the mail-part of Outlook 2000 but
without all the MS weirdness. I like the way you can arrange folders, sort
items, the preview-mode...

Hi TimW

Funny, I know another Tim Wilson who is in the MIDI scene...you are
probably not the same guy.

Anyway: a Falcon is great for MIDI and Music! New apps have been
developed such as ACE MIDI/ Tracker and AEX: very cool at 256 colors.

Ace MIDI is a full fledged soft synth. All you need is some kind of
MIDI keyboard controller (even a cheap Casio)and your off.

check out my site for all the downloads as well. Most if not all work
on the falcon

http://tamw.atari-users.net

Just a thought, and not to bash your position on the subject (I don't
particularly like CLI's either)... I don't agree that software
duplication is a bad thing necessarily. I personally would rather have
a bunch of programs that did pretty much the same thing in different
ways, than just one that may or may not work like I prefer programs
to. Just because you and I don't like CLI's doesn't mean that it's not
a useful program that someone would prefer over the software you or I
use. The more the better, I think. That's one of the things I find
really great about this platform - the variety of software,
GUI's/CLI's, functionalities, program sizes, etc. that allow you to
pick the programs that fit your needs. Some people might like using
wget instead of Fiffi. Some might like Newsie or aFTP instead of
either of those. This is a good thing. I like being able to make
choices for myself based on what I like or don't like, and don't
criticise others for making different choices. If we were only offered
one or two choices for each genre of software out there, I wouldn't be
nearly as happy with this platform as I am. I may have even left it a
long time ago!

Message-ID: <pan.2003.08.08.03.47.28.608598@nossspamXXatari-source.com>
Source record: 24772

Hello all,

I'm posting this into a public forum not to stir up trouble but just to raise the issue I'm having for discussion to see if anyone else has that same. My CT60 on the surface appears to work perfectly. It didn't like the first 256Meg stick of SDRAM I threw at it but it liked the second. I don't have the latest ABE update installed as I don't have a JTAG cable.

The latest update addresses an issue where accessing the floppy will crash the machine. On my system this issue is present but different, my scsi bus won't work at all. But when I turn of "Falcon scsi procesor device" in HD-Driver it will work, so the workaround is the same, meaning the cause of hte problem probably is the same.

But I have a different and slighjtly more important issue.

After freemint boots up, it reads that I have 3900K STram free and 3900K TTRAM free. No matter what I disable or change, nothing will get this to work right. However the system acts entirely different if I DON'T load NVDI 5.01. From there the system has display artifacts here and there and upon accessing anything that reports the free amount of TTram the system crashes. Things like Multistrip, the CT60 cpx, and the general cpx. Anything that would give me a free RAM count crashes. However if I load NVDI nothing crashes, but instead reports the incorrect amount free.

Under MagiC everything works flawlessly. Under SingleTOS the system is unstable without NVDI too. I'm not sure what NVDI changes but it sure does seem to make the system much much more stable.

I tried with TOS in RAM and TOS not in RAM. I tried changing delay settings and a whole bunch of other CT60 settings. I tried FreeMiNT 1.16 CVS kernel and 1.15.12 release kernel. Is it a MiNT problem? I suspect not, but possibly. I more likely suspect it to be a non-seen issue with the CT60. Does anyone else have these troubles without NVDI under FreeMiNT/singletos and on a full mint setup with xaaes and Thing or something like that are your memory totals correct? Are you using a BIG DIMM like 256meg?

Also I have a 68060@60MHz full chip, running at 66/16MHz. My clock buffer mod is the one illustrated on this page (first image, scroll down). it's not exactly like this one but close.

I am running without f030 clocks boost and without solders.

http://www.czuba-tech.com/CT60/english/Fitt_sold.htm

I can copy this message directly to Rodolphe or the MiNTlist if anyoen thinks it would be good.

Thanks
Mark

I dunno, mine seems to be running particularly cold. Almost colder than
the ambient temp of the room. In addition my heatsink feels ice cold to
the touch.

Update to what I said earlier:

The problem appears to be simply accessing the CT60 CPX as well as multistrip versus much else. If I load up Kronos, it reports the TTram (incorrectly) without NVDI. If I boot up a clean system without nvdi or freemint and run kronos the ttram is reported proper. If I boot up as clean as I can (MiNT + XaAES + Teradesk) the TTramis reported incorrectly. The CT60 cpx crashes under all circumstances where NVDI is not loaded.

... weird.

Rodolphe has found the problem, which was a bug in the CT060 firmware.
With the latest firmware HDDRIVER will also work with "SCSI Processor
Device" switched on. This is especially important for those using MagiC,
as the DMA background transfer under MagiC requires this option to be set.

And I found this too

From: apratt@atari.UUCP (Allan Pratt)
Newsgroups: comp.sys.atari.st
Subject: Re: TT RAM
Message-ID: <2304@atari.UUCP>
Date: 19 Sep 90 00:21:46 GMT
References: <3107@medusa.informatik.uni-erlangen.de>
Organization: Atari Corp., Sunnyvale CA
Lines: 56

csbrod@medusa.informatik.uni-erlangen.de (Claus Brod) writes:

-Is the TT's memory mapped by the MMU so that it appears
-contiguous?

No. There is no address translation going on in the MMU. If there were, every program that wrote an address into a chip (video, DMA, etc.) would have to be able to do the logical-to-physical translation. This is impractical, and would result in nearly 100% incompatibility with existing programs. The MMU is used, however, so don't mess with it. It's used to get around a bug in the 68030's design; I may explain in more detail later.

-I need this info for my hard disk driver which has to
-decide if some transfer is to be made into fast or slow RAM.

Right you are. That's what the _FRB cookie is for. But you are looking at the problem in the wrong terms: rather than deciding what kind of RAM the transfer is destined for, your program should decide only what it has to: in this case, decide if it's being made to/from a place that the ACSI DMA chip can access. This prevents you from hard-coding the location or size of different pieces of RAM. This saves you from having to re-release your driver when somebody complained that he couldn't access VME RAM with it, because you didn't think of that.

The ACSI DMA chip can access memory only in the low 24 bits of the address space, so that's your answer: you check the high byte of the transfer address. If it's zero, you can use ACSI directly. If it's not, you must use the FRB. You never examine any part of the address other than the high byte, and you only test that against zero. Minimizing the information you require in this way leads to maximum portability and future compatibility.

As an aside to SCSI driver writers, you have less to worry about. As mentioned above, the definition of accessibility on the ACSI bus is

"the high byte must be zero." The definition of accessibility on the SCSI bus is "the bus must be 32 bits wide." This means that A24/D16 VME memory is not accessible to SCSI, and you should use the buffer pointed to by the _FRB cookie.

Finally, to defeat nit-pickers before they strike, I *know* that the ACSI DMA chip can't really talk to everything in the 24-bit ST address space: it can't see ROM, for example. But it *can* access any real RAM in that space, and if you're trying to DMA to something else (like the palette) you deserve what you get.

http://www.atariarchives.org/cfn/12/05/03/0063.php here is the url, it makes interesting reading, thanks Mike very enlightening.

<huge snip>

It has to be more than just an FRB cookie, surely? The previous document was from atari and it seems to only refer to that one cookie. Is it part of Tos 3 or an add on prg? Is it possible to implement as just an auto folder prg, then? Lotsa questions. It seems strange that if it is part of Tos that it was left out of Tos 4. I can understand old apps having a cow over all this ram but, I would assume code would have got cleaner over the years. Why would Atari leave it out? Or am I just on the wrong track?

Leaving it out is logical: The Falcon does not need an _FRB. It is just
needed with certain hardware add-ons. So why should Atari add it? A
standard Falcon does not need it.
Keep in mind, by the way, that what Alan Pratt says was written long
ago, when Falcon's were not available. So not everything in his answer
may apply to nowadays.

You should remove the ST-RAM & TT-RAM tests !
Put less than 10 s in the BOOT delay in the CT60 CPX....
You don't need to loose time with these unusefull tests !

NOT exact on CT60 because the VDI routs of the TOS has been modified and you
can run in the desktop with SDRAM AND WITHOUT NVDI !!
Do the test !

NVDI provides the FRB to pass data from the
> alternate ram to other parts of the computers 16 bit bus.

NO ! The FRB of the CT60 is installed by the flash, not the NVDI !
Don't need NVDI to have the FRB !
And the width of the data bus is not the problem ....
the problem is the address space that is 24-bit on falcon mb and 32 bit on
CT60 : so a SDMA or a BLITTER chips use only 24-bits addresses and cannot
access superior addresses on CT60 and so on SDRAM.

HD Driver
> has the option to install the FRB, but I know that it doesn't work on

>like such exceptions when programming ;-)

Indeed it is de-facto an exception and complicates programming. On the
other hand, if all of that were just starting from scratch, I would prefer
the Magic's way of drawing 3Ds: object size and position should remain as
set by the programmer, not shifted around by the application trying
to compensate for whatever funny ideas an AES had of how large an object
should be and what would then happen to adjacent objects (one has to
inquire whether an AES supports giving information at all, then inquire
whether it supports giving information about 3D enlargements,
and only then inquire about the enlargement value and hope to obtain a
correct answer. Or, if anything of the above turns negative, make a
wild guess about enlargements. And finally, rearrange the objects...)

Now, an interesting detail might be in which AES or some application
the 3D look was first invented (and maybe set the trend).

HDDRIVER does *not* have this option. HDDRIVER had an option to install
the XFRB, which is not the same, and in particular has nothing to do
with the Afterburner.
As far as the Afterburner is concerned HDDRIVER includes a small program
called AB040FIX.PRG. With this program HDDRIVER solves the problem that
the Afterburner does not install an _FRB of its own.

>Second question: if you want to use true type fonts (PC style .ttf) with
>NVDI where do you have to put them? In the BTFonts folder?

Hi Jos!

You can put them there, or wherever you like as long as you enter
their path(s) in NVDI.INF. Subfolders are permitted - you only have
to specify the outer folder(s).

I have mine in a TTFONTS folder which I don't normally need to use
as I have enough Speedos. But when I do, I just remove the leading
semicolon in

```
FONTPATH = F:\BTFONTS\
;FONTPATH = F:\TTFONTS\
```

and they become available. Note that such a change slows down booting,
since NVDI has to write a new FIFPATH file, collecting info on all
the installed fonts. Once done, you will find booting as fast as
before (unless you change the installed fonts again!).

Regards, /Peter/

I think there must be something wrong with your setup of MagiC or
some of the other programs running - or perhaps a hardware fault.
I can leave MagiC running for days on my Falcon and come back to
it still running perfectly. I don't say MagiC never crashes - but
when very occasionally it does it's either because I've done
something silly or am using a 'dirty' program.

What do you mean by unstable ?

Cache delay is just a feature for start old or packed programs.

I have 256 MB, MagiC 6, MiNT 1.16/ XAAES and the TOS 4.04 works fine
with NVDI 5.01. I use MiNT for compile the TOS with Gcc, but my main
configuration is MagiC.

> Also I have a 68060@60MHz full chip, running at 66/16MHz. My clock buffer

66/25 for me.

Maybe you can try to remove some XFS or XDD. MiNT 1.16 works fine
without patches.

Regards,

Didier.

Can you try with ZCONTROL or XCONTROL ?

I don't know if MULTISTRIP is 100% compatible with XCONTROL, but it's
possible than the first problem is the cache, read the doc. The TOS
cannot fix all problems and the TOS cache features not exists under MiNT
or MagiC, under a 060 a program who not use the Pexec TOS function like
XCONTROL crashes when it start the CPX module because Pexec TOS call
isn't used. Only COPS flush CPU caches before start the CPX, but
ZCONTROL works fine under MiNT. And XCONTROL is patched for the 060. I
havn't tested Multistrip.
The CPX use all features of XCONTROL and more, for example threads are
used under MagiC and it's also possible than MULTISTIP not support this.

1. In real life you fortunately don't have to care about this, as all
AESes that draws the border outside the objects use the same width on the
borders.
2. If you want to be 100% sure that everything looks properly, you have to
apply the same checks when the border is drawn inside the objects as well,
since otherwise the border might conflict with whatever you put inside the
object...

> Now, an interesting detail might be in which AES or some application
> the 3D look was first invented (and maybe set the trend).

The first TOS to feature 3D objects was 4.01 I think. When was this
released? In 1992? MagiC got 3D objects in MagiC 3.0, which AFAIK was
released around the same time, perhaps a bit later.

Source record: 24848

I just found the world's most powerful BASIC programming language for PC....called....

BlitzBasic3D - in which you can create powerful 3D/effects or even video game environment - texture mapping, camera, lights, sprites are supported!

I just couldn't believe to see a demo version showing a simple 3D mountains (bump-mapping support too), with 3D model of a textured-mapped castle and a little mario-like guy running around the environment.

The program is about a page and half long on my screen.

Totally impressive! Not sure about DarkBASIC.

What are the others BASIC out there for PC that handles 3D graphics capability??

Please email me the video connection flow diagram so I can understand your video connections between STe and SVGA monitor.

I didn't understand what you mean "video converter" or what does it look like in between.

Connecting your STE to a VideoKey box is understandable. But it is missing the SVGA video out port in order to be able to connect to my Dell 17" monitor. So what is missing here?

Mike

5369. Re: Trying to read old ST disk on PC's drive

Source record: 24850

Will this help me if I use:

http://home.tu-clausthal.de/~ifmar/makedisk/

regardless of the different variations of boot sectors on my ST disks? (I can't remember which TOS version I use to format those disks)

So, in theory, it is possible to put in ST disks (no matter what or who or how I format it) in the PC floppy drive and make a disk image out of it?

Once I put that disk image on PC's hard drive, will I be able to use this in, say, STeeM emulator, as long as it is .st image format?

The problem: I have 2 ST disks - one has Spectrum512 software and the other has a number of .SPC files. Is it possible to have 2 .ST disk images in a emulator?

Or do I have to create a Ramdisk in the emulator , in order to copy the "Spectrum software" .st image disk and those ".SPC files" .st image disk stored in a single place?

If Ramdisk is possible, then is it possible to make a .st image file format from the Ramdisk, after I managed the 2 .st files in one place.

Kinda COMBINING .st images in to one SINGLE .st image.

Mike

If I use:

http://home.tu-clausthal.de/~ifmar/makedisk/

to make a .ST disk image format out of my ST disks (one by one at a time) in the PC floppy drive and stored those .st disk on my hard drive, and...

if I put 2 or more .ST disk images in the emulator's ramdisk (not sure how to do that), then

how do I create a SINGLE .ST disk out of this RAMDISK, in this STeem emulator? So that way I will have a working .ST disk image ready to be used in emulator the next time I boot up and run emulator.

Does it make sense to you? I dont have MegaSTe here.

Mike

5371. Re: Where can I find PD software for the ST?

STeem works better - like a charm on a PC. Either in scalable window or full-screen mode.

Is there such thing like Falcon-emulator for PC?

I have seen Tempest emulator (Jaguar for PC) and Handy emulator (Lynx emu for PC)!!

Finding the .rom or CD titles are harder to find now.

Why not use the world's most powerful BASIC programming languag of your PC - called "BlitzBasic3D"?

You can create all kinds of 3D capability (texture mapping, bump mapping, fog, camera, lightings, fog, etc) using it.

You can make a executable form for distribution to other user to play your game titles. Amazing!

I saw a demo version showing a simple 3D landscape with 3D textured mapped castle with a Mario-like character running around in this 3D environment.

The program is short - about 1 -1/2 page long. Raw processing power gives you raw programming capability. Cool.

Not sure about DarkBASIC 3D capability. Any one know of any other ones out there?

Hallo Jo Even!

JES>In2Cat? I had the impression that this only works with IConnect.

That was the case initially, but has been extended to use STinG (or GlueSTiK)
and also the Windows TCP/IP Stack for MagiCPC. Sources have been made available
some weeks ago, too.

JES>I must admit that Cat looks interesting though.

I must admit that I still haven't finished the translation of the main help
file :-(

Hmm, would Chu Chu Rocket by Reservior Gods count?

Needs 1mb to run but for full sound requires 2mb min.

Could this be no. 1, certainly is a fantastic game.

Bonjour Derryck :)

>I have some suggested changes for the resource file for you which I will
>forward to you when I've had a chance.

Okay :)

>Will it be possible to print via NVDI or GDOS in a future version?

GEMDOS print surely.
I have not yet studied NVDI printing, so I can't tell
if I'm able to do it, but it's planned. For better presentation,
different "models" / "canvas" should be managed / proposed, so
it's a bit harder than expected.

>This is a nice program :-)

Thanks, trying to do my best, but time and support are lacking ;)

Peter,

Hrmm.. This happened only once with the CT60 so far but on original falcon hardware and such it happened quite often. Also happened on Mega STe a lot and TT not often. Seemed very erratic on different hardware. Definately seems due to how "close" MagiC is to the system being written in straight asm.

I don't see how my setup can be wrong. I have up-to-date stuff.. Nothing strange running, COPS, NVDI 5.01, magxdesk, etc. It's a rather bland stock setup. MagiC crashes weirdly for me on all hardware.

SYSTEM ANGEHALTEN

- all the time.

Like I said though, it sucks that this happens. I like MagiC. And it's not like I have some warez copy or something. I have several different versions of MagiC on original disks and a CD. I don't know what more I could change to make things more stable?

Well Multistrip is just a task bar versus a control panel server. I have
tested xcontrol with the CT60 cpx under TOS and get an exception, that is
only when not running NVDI (clean system).

I was simply noting this because I don't understand the source of that bug
or the symptoms, I wanted to point out that I didn't have the latest ABE
update just in case that is important.

But yeah, I realize that this has been fixed and now I need to make/buy a
JTAG cable so I can get it :)

Rodolphe and Didier,

You've pointed out that the responses to be inquiry are wrong regarding the use of NVDI. Theoretically I can boot up in most configurations and everything will work. Two things important to note:

1: without NVDI under MiNT, certain things are very crashy. Namely explode.prg that comes with xaaes, multistrip (which reports TTram amounts), under XaAES and N.AES there are display artifacts left all over the place. What I mean by this is that there are little trails left behind the mouse that didn't update properly. So under N.AES for instance there will be purple blotches left all over the menu as you run through it. Randomly on the screen there may be one or two discolored lines also. Finally the CT60 CPX as well as the Atari general cpx that allows you to turn caches on and reports ram amounts crashes. However! My initial thought that this was due to TTram amount might be null. I can run Kronos and it properly reports TTram amount.

Unless otherwise indicated I am using MiNT 1.16, and unless otherwise indicated I have tested with a 1.15 kernel and without ANY xdd/xfs.

2: Under SingleTOS there are NOT display artifacts or problems on a clean boot without NVDI, however under COPS or Xcontrol the CT60 Config CPX will crash on load using COPS or Xcontrol (haven't tried others).

Like I said, this is really *not* a big deal for me because there isn't many conceivable situations where I won't run NVDI, however this may be something that you guys would want to look at. Any more details and tests you want me to give as well as the error output under certain situations is fine.

One thing that occurred to me is that I might not have the most recent version of COPS. Or perhaps another CPX (original Atari control cpx) might be in conflict. Does't explain display weirdness under MiNT or explode.prg crashing (weird, it works with drives).
Thanks,
Mark

Maybe it's just not possible with your monitor ?

I have a 15" IIyama TFT monitor attached to my CT2b/Falcon. I can get the standard Falcon 640*480 resolutions and also the 640*400*2 ST mode very nicely. The only extended mode using Centscreen that is working on my setup is a very useful 640*480*TC.

Something coming close to 800*600 or 1024*768 doesn't work. In the my monitor's manual is a table with possible resolutions. The bigger screens just don't fit my CT2b's frequencies.

Take a look a Aranym. According to the development team it is not a
(Falcon-) emulator but a "virtual machine". Who cares.

Take a look and judge yourself:

Yes explode crashes without NVDI and Multistrip causes a system reset.
Without SDRAM, it's OK. Maybe Multistrip not like lot of SDRAM or maybe
there are a bug inside the blitter VDI patch. This patch need SDRAM
memory free for copy block to the STRAM. Under XAAES and without NVDI
there are bad pixels in the icons, it's strange because icons are good
under TOS.

Regards,

Didier.

Didier,

I'm glad you were able to replicate the problem. Maybe we'll find
something else wrong that will improve overall stability (not that there's
any problem that I can find with that).

Thanks,
Mark

Most newer PC's and floppy drives seem to have a problem with old single sided, single density 3.5" disks though. The only program that I have been able to get to make any kind of a copy of those, (or to even recognize that the disk is formatted) is disk2fdi. http://www.oldskool.org/disk2fdi/

Is anyone else aware of any other programs that can handle the old single sided, single density (360k?) disks?

Thanks, Duncan

That feels dangerous; assumptions like that can lead to trouble
because it is not stipulated that 3D enlargement must have a certain size-
and besides, I sort of remember that this value might be changed
in at least one of the available AESses, isn't it so?

>2. If you want to be 100% sure that everything looks properly, you have to
>apply the same checks when the border is drawn inside the objects as well,
>since otherwise the border might conflict with whatever you put inside the
>object...

Hmmm, you might be right... though, it seems to me much more often that
a number of objects is to be positioned one next to another, than it
is to have to position them along the inside border of a larger object.
AFAIK, currently in this case one can't even inquire about border size,
as Magic does not provide that function (and even need not always
draw objects in 3D).

Hi Tim-

I just want to say THANK YOU for keeping the Atari midi community going so strong and for being so organized. Thanks also for the update info. The Atari community could certainly use more folks like yourself. Please keep up the good work! Even tho I also have a PC laptop, I still use my Atari Falcon for all midi needs. I use Hybrid Arts' EditTrack Platinum. It's very efficient, and fits my way of sequencing very well. My @#! PC has a midi timing delay. I can't figure out WHY, and don't have much patience with it - especially since I have a Falcon that worked GREAT for midi right out of the box!

Yes, that works, but i like to use 1024x768. Use 928x7xx with an
older CRT multisync before. Standard modes good for booting :)

> Something coming close to 800*600 or 1024*768 doesn't work. In the my

800x600 works, but it is not realy clear.

Yes. One time i got what i want but i forget to save the setup ;/
I canï¿½t recall this setup again, so i ask for.

At the moment it looks like the CentSreen Setup do not allow 1024x768.

???? strange...

You can get my VIDEO.DAT with 1024*768, 16 and 256 colors at
http://ginesj.free.fr/VIDEO.DAT

The 1024*768 rez has 41kHz horizontal, 51Hz vertical, and IIRC you
can't get higher V freq with the 50MHz videl clock.

The manual for my monitor (Belinea 10 15 35) mentions 56-75 Hz
range for the vertical frequency, but runs fine at 51Hz.

According to the manual for HDD 8, it can be done, for removable drives,
if formatted as a single sector, and formatted as DOS compatible.

The dos clone presumably needs a SCSI drive connected through a SCSI card.

If you are not using HDD 8, all bets are off.

So exactly what have you done so far, and what have you done it with?

Jim

I am an 8-bit Atari guy but in going thru my stuff in the basement, I found a Stacey and an STBook laptop. I looked at e-bay but there are no records of these things selling online. Most of my ST stuff (1040ST, megafile 30, and like that) have little value.... are these laptops in the same category? If they are worth something, I wouldn't mind selling them - or trading for some really good 8-bit stuff.

Well if you go off some of Derryck Crockers ideas further down the list I would say at least £5000 each, again seriously both are much sought after items, both are worth a few hundred pounds/dollars so you do have a good bit of selling or trading power, the STacy is of particular interest to musicians and recording studios so don't be tricked!

Hi, Bob!

BW> a Stacey and an STBook laptop.

These laptops range in higher categories than standard STs, though both have the same nominal power.

Musicians prefer the STacey to STs, as it is fairly robust and needs no separate monitor (SM124). Prices have been rising since eBay became more popular. Depending on how used it is you could trade it for 100 to 200 EURO.

The STBook really is a rarity. Only a few thousand of them have been produced. I paid about 320 EURO for a working but slightly damaged STBook two years ago. I had to recondition the Accu-Pack and adjust the case. Some parts of the case are missing.

STBooks in perfect state sale for 600 EURO and more - if you find collectors willing to pay that price. And I guess, they will. I would like to buy a STBook with complete case and maybe 4MB RAM... but my financial situation is not that good at the moment :-(

Special bonuses are if the STBook comes with 4MB RAM or if you have some (built in) extensions like modem, HD-adaptor-cable or (if existing at all) external floppy.

Regards,

Alexander

PS: I don't know where you are from, so I simply wrote down "german" EURO prices.

My thinking is that not using the built-in printer routines would make it possible to use Cresus under emulators and would at least double your audience :-)

You could also add the possibility of colour printing.

I don't know what practical differences there are between GDOS and NVDI printing.

>> This is a nice program :-)

> some of the other programs running - or perhaps a hardware fault.

I totally agree Peter. MagiC 6.20 running on my Falcon is the most reliable OS I've ever used (aside from TOS) and beats the pants of Windows and even Mac OS 9.2.2.

Have you tried the old trick of turning pre-emptive multitasking off in your
Magx.inf file and turning it back on once your system has loaded in the CPX?
Lets your auto folder etc progs load and run to completion before the next
one starts.

I don't have the details of the exact command that you enter in the inf file
to hand.

Hi,

I have never felt much need for a computer at home for anything other than music which my falcon does well of course, as i have always used computers at work. However I am off to university soon and was wondering if there was still development on the platform, in particular I would need

- An Outlook type application, maybe not combined but a decent calender program and emailer.

- Is STing still the main dialer software?

- I would also require word compatable processer and excel compatable spreadsheet prog.

I have a basic magic setup, althrough ram is a little limited at 4mb

- also the facilities at uni facilitate eithernet, is ethernet avaliable for the falcon?

sorry for all the questions!
thanks for any help

Papyrus can import and export Word files. Texel is Excel compatibel, when
saved in an older Excel format.

I dunno. To me this is a strange one. Doom ran pretty good on my Intel 486sx33. Logic would suggest the engine can be tuned up a bit to run faster. Also that machine only had 4 megs of RAM. Then again it also ran quite a bit better on my dx2/66.

I haven't tried that but I cannot honestly believe that will help since
things are still loaded serially even though preemtive multitasking might
be enabled. Maybe I'm wrong though.

Thanks,
Mark

PS: And my stability issues come after many hours of use usually.

Multristrip works if I remove the caches, I think I you want use
Multistrip you must move his CPX folder or works without caches :-(
You can't see this problem with NVDI, because the cache job is
different.
And the bad pixels is normal on my config, my blitter has some problems
with the bus at 25 MHz. It's good at 16 MHz.
About explode I don't know because I have removed the caches after his
crash.

Regards,

Didier.

Multistrip works like a charm on my CT60 with the caches enabled. (both MiNT and MagiC)

Which version do you use? The mine is the 1.55

I had some problems with caches (specially the branch cache) on some software at 72mhz but at 66mhz all is fine.. Maybe you can try a lower clock rate.

Regards,
Zorro.

I have no experience with Papyrus, but as a general rule, I suggest caution when dealing with Word import/export functionality. AFAIK, no programs do it 100% perfectly. (Ironically, this includes MS Word -- different versions and installations on different machines yield different results. Still, MS Word does it better than others.) As a general rule, you'll do OK with simple stuff like letters that contain no fancy formatting. Once you start adding hanging indents, columns, non-ASCII characters, "smart" quotes, inline graphics, etc., you're more likely to start running into problems. Problems are also likely to show up if a file goes back and forth several times, as when you're collaborating with somebody on a project. If possible, test any program you intend to use with documents similar to those you'll be creating to evaluate its ability to handle the job.

>> - also the facilities at uni facilitate eithernet, is ethernet
>> avaliable for the falcon?

Look into EtherNEC (http://hardware.atari.org/ether/index.htm). If I understand correctly, this will provide you with a 10Mbps connection, but not 100Mbps.

> calender program and emailer.

I don't know of many really great calendar programs, other than
CALAPPT, which I think came on the Falcon's included software disks.
As for e-mailers, there are a good number of them to choose from. If
you use STiK, you have aMail, MyMail, Newsie (which also does
newsgroups, FTP, and *basic* text-only web browsing), and a few other
older programs. If you use I-Connect, you can use the ASH E-Mailer
program, and the above STiK clients if you have IFusion for I-Connect.
If you use Draconis, you have Marathon, and maybe others?. If you use
STiNG, you have the above STiK clients plus the Draconis client(s)
with the Draconis emulator. If you use MagxNet, you can pretty much
use any of the above, as MagxNet has emulation for all of these, plus
some Mint-Net clients.

> - Is STing still the main dialer software?

As above, there are the following that can be used on Magic:

STiK 2
STiNG
I-Connect
Draconis
MagxNet

All of these are freeware, and so can be downloaded and used right
away. Some are easier to setup and use, and on certain systems, some
work better than others. But at this point, I think it's mostly a
matter of personal opinion which one is the best. I personally use
MagxNet. I have used STiK and STiNG in the past and can recommend both
of those as well. I've never used I-Connect, and I've never gotten
Draconis to do much.

> - I would also require word compatable processer and excel compatable
> spreadsheet prog.

The only Word-compatible word processor I know of is Papyrus. It's a little over $100 (US), but well worth the price. Very nice program! It also has a great relational database, and some spreadsheet functions that you can use in frames within a word processing document.

As for Spreadsheet programs, the only Excel-compatible one I know of is Texel. The biggest problem is that it is only compatible up to Excel 4.0, and not newer, so if you get sent Excel files from a PC user these days, chances are good that it won't load them. You'd have to ask the person sending them to save the file in Excel 4.0 format, or any other format that Texel can handle. Otherwise, Texel is a very nice program as well.

> I have a basic magic setup, althrough ram is a little limited at 4mb

I would highly recommend getting a memory upgrade if you plan on using the computer for any serious work. I would also recommend an accelerator. Even an old Nemesis or something similar would make it a little more comfortable to work with. If you're one of the extremely lucky few who can get a CT60, I'd do it! Tons of speed, up to 512Mb of Fast SDRAM, etc.

> - also the facilities at uni facilitate eithernet, is ethernet
> avaliable for the falcon?

Only two options that I know of:

1. There are a couple adapters that use the Falcon's ROM/Cartridge port to connect to an ethernet card. These have their good points, like nice speed, stability, and a lot of available drivers. The bad point that I've personally run into is that if you use Cubase Audio, or any other program that uses that port for any reason, it can be a pain having to swap them all the time, especially if you have recased the machine like I have, and the port is pretty inaccessible.

2. There are a few SCSI->Ethernet adapters made by DaynaPort that drivers are available for. This would solve the above problem. However, these drivers are only available for STiNG at the moment, and don't allow access to the Floppy drive while activated. I've also heard of some other minor problems with these. Not to mention, the actual adapters are hard to find.

> sorry for all the questions!

That's what this group is here for! If you need any more specifics on things I've mentioned, please e-mail me!

Well I have not tried it on my Falcon030 yet, but on Amigas with a 030 and 040, and 060 it ran good, better, great!!!!

I remember on the 040/25Mhz it was 10-12 fps @ 320x200. 060/50MHz 35 fps. So 4 fps on TT 030 might be about right?

I suspect the engine needs a lot of work. I know ADoom on Amiga went through a lot of betas to get to where it is. I must say it is almost a flawless port with lots of extras.

Message-ID: <c13642a2.0308111424.55744089@posting.google.com>
Source record: 24728

I was hoping to get my hands on a Falcon system, but have been having a hard time finding said systems. I saw one on eBay that was perfect, but missed the chance. I'm looking for a complete system (falcon, mouse, monitor), and what ever else I might need to get it networked. If anybody has any ideas as to where to look (in the US), I'd love to hear them.

It's a matter of commenting out the #_TSL line, rather than adding a
command. E.g. I disabled it on my old system by changing the line:

#_TSL 4 32

to:

;#_TSL 4 32

Possibly, on a stock Falcon it is verrry slow, on a CT2 with 78 meg of ram it is quite playable. But that is around twice the performance of a TT. I think the doom for falcon does not use the DSP if it did it would rock. It would have to be written from scratch, the Atari version is a linux port for 680x0.

Does anyone anywhere have a list of what these 3-letter commands all mean in the MAGX.INF file? I've been told by a few people that it is better to edit the file using a text editor rather than using one of the GUI-based configuration programs (is this correct?). However, I feel really uncomfortable changing things when I have no idea what most of it means. For example, I've heard this advice about turning off pre-emptive multitasking a number of times, but usually this advice comes with no explaination of how. And TSL doesn't exactly scream out to me that it has anything to do with the multitasking mode used, so this wouldn't be the obvious choice if I were to guess. There's also nothing about this in the meager 40-page leaflet that came with my English version of Magic 6.01 (passing itself off as a manual). So it would be nice if there was some sort of reference web page available (multi-lingual preferred, instead of just German). Is there?

> I take it there is no software I can run to fix this, I just need more
> CPU horsepower dont I? :P

The TT does not have a 320x200 video mode, so the program needs to convert it from 320x200 (1 byte=1 pixel) to 320x400 (software double-lined mode, and chunky to planarconversion), for the 320x480x8 bits TT mode. A video card like the NOVA, which has (IIRC) a 320x200 mode (1 byte=1 pixel) could improve performance.

Also, this is not a straight unix port, I rewrote the texture mapping routines in assembly, because the original C ones where twice slower. You can also disable sound ('-sound off'), which takes a bit of power.

One thing that could improve performance would be to disable texturing on floors/ceilings, and maybe on walls (except for doors ?).

Finally, for the Falcon and if custom DSP routines were written, I would expect a 2x performance decrease against badmood, because of all the work to do in extra (IA, game engine, collisions, etc...).

It ran perfectly when it just came out on my then new 486DX40 had 16mb of ram and had a SoundBlaster 16. was great.

perhaps the stock TT's video is horrendously slow, maybe a video card would help.

Shame no ones made a Video, CPU, RAM & Ethernet card all in one for the TT, would be an ideal piece of hardware.

Indeed. I have played Doom I on TT with a graphic card, and it *was*
playable, of course after reducing the image size and turning low detail
mode on.

Without a graphic card, I guess that running in 320x200 grayscale mode (16
levels of gray, ST-LOW) would help to make it faster, but I couldn't set it
to work in this mode. Only 320x400x256 color mode (TT-LOW) was available on
a standard TT display.

5461. ST data recovery software

Newsgroup: comp.sys.atari.st
Date: 2003-08-12 11:10:24 UTC
From: Harald Loos <tty@gmx.net>
Message-ID: <3f38cb01$0$27686$91cee783@newsreader01.highway.telekom.at>
Source record: 24742

Hi,

I'm trying to backup my old ST-disks using MSA and transfer them over to my PC, but unfortunately I found that a lot of the disks are corrupt, so I won't be able to get them in an image file.

As most of the disks seem to be at least partially readable (I can view the directory structure and open files from the desktop), I was wondering if there is any data recovery software around, that saves the readable data on a disk, which I could later transfer into an image.

Copying files manually is quite a hassle, since I would have to copy each file seperately and see if it's readable. Also I think a low-level approach would be much cleaner (that skips bad blocks and saves the ones that are working.) But I guess most recovery software does it like that anyway.

Any help will be much appreciated.

Regards.

> capture 320*240 ~12fps. The CT060 should speed this up a bit:)

Don't forget to cut the trace between pin20 and 22 on your Expose and
NOVA because otherwise they won't work with the ct60.

Unfortunately I have to tell you that althought from the hardware
point of view the NOVA works, the NOVA VDI crashes on the ct60. :-(

So ATM there is a decision to make: ct60 OR Nova :-(

Apart from that my screeneye card works flawlessly with my ct60. :-)

BTW, if there is someone outside who also has a screeneye, do you know
that there is a free software that even works with a graphics card?
(the original software only worked correctly on VIDEL video modes).

Regards,

Frank

The video card would sure help, but perhaps more because of its pixel
format being the same as the one originally used for programming the
game that for better hardware.
The original TT hardware uses a different pixel format so a conversion
must take place for each image...

> Indeed. I have played Doom I on TT with a graphic card, and it *was*
> playable, of course after reducing the image size and turning low detail
> mode on.

IIRC PMDoom actually recognizes graphic cards and performs no pixel
format conversion in this case!

> Without a graphic card, I guess that running in 320x200 grayscale mode (16
> levels of gray, ST-LOW) would help to make it faster, but I couldn't set it

Actually a relatively slow version of the conversion routine is used
in PMDoom, so replacing it with a better one could enhance the
framerate somehow. You can browse the CT60 Forum on the DHS site for
details about this: CT60 users find it too slow for them too! :-)

From: mail@freeman-studio.com (Mike Freeman)
Date: 7 Aug 2003 18:01:30 -0700

Hi Mike,

>If we were only offered one or two choices for each genre of software out
>there, I wouldn't be nearly as happy with this platform as I am. I may have
>even left it a long time ago!

True...
But what if for a particular genre there is nothing? I've often wondered when a programmer starts a new project how he goes about it. Does he decides on a blue monday "this platform needs another mailer", or is it because there's nothing available that suits his personal needs. Perhaps it's on demand or if it's a commercial venture, a project which will sell guaranteed a number of copies...

>the variety of software, GUI's/CLI's, functionalities, program sizes, etc. that
>allow you to pick the programs that fit your needs. Some people might like
>using wget instead of Fiffi. Some might like Newsie or aFTP instead of
>either of those. This is a good thing. I like being able to make choices for
>myself based on what I like or don't like, and don't criticise others for
>making different choices.

I wasn't criticising Ekkehard for his choice, I tried to show that there are alternatives which can do the job as well. There are hardly any differences in features between wget and Fiffi anyway. But the main difference is that Fiffi is a true Atari program, with "true" I mean that the programmer went through the trouble of adding a bunch of protocols to the program, which doesn't only make it a pleasure to work with but in addition anyone using it will feel right at home... call it the famous "Atari spirit" if you like. He also took the time to give it a very nice looking GUI, that nice looking GUI is a useless feature ofcourse, but it shows off what can be done on this platform if the programmer puts his mind on it. You have a Mac also... surely you must know that Atari apps can have a much *more* versatile and feature packed user interface? And I'm not going to mention the window crap....
Wget on the other hand is a ported app, that doesn't necessarily have to be a bad thing, but it alienates from this platform. One could just as well be using it on a PC or Mac. The fact that it runs on a Atari doesn't make it a true Atari app... I could just as well run SmartFTP on a PC or CaptainFTP on a Mac, one common factor these apps got is that they do the job. If I can choose between such apps and a real Atari app, the choice is easily made...
As for Newsie and aFTP... I like aFTP, but Newsie is out. An ftp client that does not allow me to enter an ftp server of my choice was acceptable ten years ago, today however... people commenting on different programs should have worked with them, I don't think there's one ex-Newsie user out there who would return to

it. It has a couple of pro's also ofcourse, for people with low memory machines it might be the only app allowing them to do their thing, and since it has three clients packed into one program...

>Just because you and I don't like CLI's doesn't mean that it's not a useful
>program that someone would prefer over the software you or I use.

No ofcourse not, that's not what bothers me. It's the way that these apps are presented here... except for a few they don't really offer anything new, sure an app like wget can be usefull, but is it that we've been waiting for? One thing this thread has made painfully clear is not to expect too much from ported software, although there's a wealth of it available, porting them over can't be done for realistic reasons (computers lacking the power to run them). Meaning that the best to hope for is CLI based stuff, I'm convinced that something similar can be written for this platform that not only is more user friendly but will also have more features.

A little off topic but what the heck...
The last couple of weeks I've been playing with the brandnew Tempus Word 5.0 NG which was released recently, this once famous German word processor is unknown by the international community, it never was released in English. Today it has to compete against the likes of Papyrus... well Mike, just take a look at it. And you'll understand what I've got against ported software. Papyrus is ported also, not from open source but from PC. There are *always* trade offs to be made, and in this particular case it's speed. Don't be fooled by the somewhat outdated look, this app has got more power and features packed then anything we've ever seen on this platform. Remember it's a word processor, it doesn't pretend to be anything more... if you wanna construct a website with it, you're gonna be very disappointed. If however you need to write large docs, books, manuals, thesis or anything else which can be described as "being productive", then there's no alternative... We've been brainwashed long enough by ROM... download the fully functional demo from http://www.tempus-word.de and see what word processing on the Atari platform is really all about.

Yes, I know it's all in German.... the programmers however will make an English version if at least 100 people express their interest in it.
"Expressing an interest" means what it sounds like, it's not committing yourself and certainly not paying anything up front either. Together with Calamus, this app is one of the reasons many people in Germany stick to this platform.... I think that the English community finally deserves an English version, it's been long over due.

Hi Jo Even,

>Anyway, it wouldn't be a problem at all if programmers who develop
>under MagiC just tested their resources with atleast one of the other
>AESes (if their application is intended to run on them). But many times,
>they don't. This is the problem.

Sure it's a problem, but sometimes it can't be helped. What about for example programmers developing under MagiC-PC or MagiCMac? You can't expect everyone to have three OS's installed either. A lot of these problems can be prevented however applying some serious beta testing. Jinnee for example was programmed under MagiCMac... without the input from Steve Sweet, it wouldn't be running under MiNT at all...

Cheers from Belgium

>what I'm looking for. However, the program keeps on crashing everytime under
>MagiC and under single TOS. (Falcon 030)
>
>To be more precise: it stops. No mouse or other reactions. There are no
>bombs are messages. It just stops working.

This sounds very familiar...
When it was released a couple of years ago, I was about to translate it, but since it kept crashing or just hang, I told the programmer that I would wait with the translation until there was at least a stable version available. Ever since, the programmer has released lots of updates, but the problems remain...

It's available in three different versions, on the TT030 I use the 68000 compilation, I know that it doesn't make sense but that version at least runs for five minutes before locking up... both the 68030 and 68082 versions do absolutely nothing here. There's not a lot one can do in five minutes, but if you're a little organized you should be able to convert at least a couple of icon sets.... ;-)

Hi Jo Even,

>I don't agree with you in this particular case. There are no really good
>mailer on our platform. aMail is good, but crashes all the time when
>dealing with attachments. Marathon Mail won't even start on my Milan. ASH
>Emailer only works under MagiC and isn't really good on that OS
>either. MyMail is not bad, but to be honest the GUI is quirky.

But that can be said of almost any other application also. There isn't a good
browser, spreadsheet, database, word processor etc...
Almost anything has limitations, but at least there's choice. What suits me
doesn't necessarily have to suit you... but certain applications are catered
for much more then others. We have at least a dozen mailers on this platform,
and not one single dedicated newsreader...
I have no idea what you mean about ASH Emailer not being so good under MagiC,
together with Okami these two are the only ones who don't screw up. They don't
loose track, they don't "loose" mails or posts, they both confirm to the RFC
rules, they can follow threads until kingdom comes etc...
I don't agree with Martin very often, but he's right. Okami is the best and
most versatile mailer on this platform. ASH mailer is just as good and also
easier to use but since it only runs under MagiC and can use only one stack,
Okami deserves the first place.
But whatever, if everyone here would start using one of these two apps, this
newsgroup would be a lot easier to follow....

>>That is not quite the same thing is it?
>
>Okay. Not sure why it would make your stomach turn. Seems like MagiC
>becoming more stable on all platforms would do everyone good.

MagiC *IS* stable!!
Do you really think that it would be my and others preferred OS by choice
if it hangs up/crashes all the time? When will you finally grasp what me and
a lot of others told you? If it's not stable on your computer, then blame
something else....

>And adding the option of having MiNT extensions would totally rock and make
>MiNT not my system of choice and XaAES not my AES of choice.

If I wanna work with a OS that has MiNT extensions, I'll use MINT. You may
like the idea of MagiC becoming a second MiNT, I don't... they are both
unique in their own way, and should remain like that.
I like MagiC the way it is, I also like the philosophy of the programmer and
I can understand his reasons for not changing MagiC and turning it into a
MiNT clone. If it would ever become GPL then in no time it would loose it's
"spirit" and be "alienated".

>Unfortunately for everyone involved, MagiC is still LOADS faster than
>anything else. Even if you have a CT60 like I do now, it's STILL
>noticeable.

You don't have to convince me!!
Tell it to Jo Even and Adam, they're not convinced at all...

>I'm just tired of it crashing every time I walk away from the computer for half
>a day and come back with nothing running.

Ah.... but I'm a happy lunatic :-)
My computer(s) can run for months on end without crashing.

>Machine problem? Funny, MiNT doesn't do that.

Well then it's very obvious that you haven't setup MagiC properly...

>So yeah.. I'd like an update.

IMO an update won't fix your problem. Almost all MagiC 6.20 users I know have a
very stable setup. They would like to see an update also ofcourse, but not for
the same reasons as you.

>But it's very poor fodder for you to suggest that there will be updates. You
>sound as much like a fool pushing your MagiC is the way of the future BS as you
>might think I do quoting a word for word reply that says "No I don't think so".
>Hrmm.. Seems like a No answer to me.

I don't really care what it seems to you... all I can say is that the programmer
hasn't abandoned MagiC, and that's good enough for me. And I don't really give a
damn if future updates are distributed by ASH or not.

I don't even leave CAB when encountering such a problem, the "surf" module takes care of it. I copy the URL to the clipboard, open the module, paste it back in and that's basically it, so I like I said, there's no need for stuff like wget here.

>strange running, COPS, NVDI 5.01, magxdesk, etc. It's a rather bland
>stock setup. MagiC crashes weirdly for me on all hardware.

No ofcourse you don't see it. You refuse to see it... :-/

BTW: NVDI 5.01 is NOT up-to date stuff. Not that it matters much really...
MagiC crashing certainly isn't because of this. If it would crash on just
one machine then a mechanical problem could be blamed. But since it crashes
on all your machines, the conclusion is simple: you've got an incorrect
setup...
So it's up to you: you either try to get the problem fixed, or keep whining
about it until kingdom comes. If you like to get it fixed, just mail me...
Attach you're magx.inf file, and list *all* the stuff that's inside your
Auto and the MagiC START and XTENSION folders including their size. I'm
convinced that after a little "tuning" your machines will be running for
months on end as well.

>Like I said though, it sucks that this happens. I like MagiC. And it's
>not like I have some warez copy or something. I have several different
>versions of MagiC on original disks and a CD.

The only version you need is the latest one, preferably the full English
6.20, released early this year... It's not essential but it comes with a
couple of bug fixes which were introduced in the German 6.2 patch.
Oh, and coming to think of it, with the English version Oliver Buchman and
ASH had nothing to do. It was a 100% Andreas Kromke project with some input
from DDP translations. Just an example of how much a "I don't think so" is
really worth...

>I don't know what more I could change to make things more stable?

Well, be sensible just for once and mail me :-)
What have you got to loose?

Cheers from Belgium

Well if you can find and collect some of the single file version of games,
those will run off a HD just fine! I have a few dozen I have been
collecting. I guess these are cracked and compacted versions.
Unfortunately this is the only way so if you have a problem with that,
continue using disks...

That's all fine and good, but how would one know that disabling this
"Time Slice" variable would turn off pre-emptive multitasking and turn
on cooperative? They don't exactly make it obvious, is my point.

Exactly. Magic's manual should come with at least a list of
variables/commands that are usable in the MAGX.INF, describe their
usage in plain English (or German, or French... etc.) and let the user
have a little more info without being so complex and convoluted with
"programmer-ese" that it's impossible to sort things out for the
"average" user. Or at least there should be a web site with this info
available.

Hi Mark!

Perhaps a rogue ACC or CPX, or 'wrong' AUTO folder or START folder
order? I use XBoot, which shows the order of AUTO, ACC and CPX
folders and have various booting set-ups, one of which is a clean
computer with only XBoot itself in use. This allows me to check if
there is any problem with the hardware very quickly. Then I can
add ACCs, CPXs and AUTOs one by one. Unfortunately the MagiC START
apps have to be switched on/off externally :-(

Regards, /Peter/

That seems to point to hardware problems - overheating somewhere?
Do you have a fan fitted? My Falcon has it over the power supply.

The other possibility might be a memory leak somewhere, leading to
a buffer overrun or similar. I have some programs (?Look'n See? -
can't recall) which when used repeatedly is a session suddenly
report memory shortage, even though there is plenty of memory
left. They either don't clear up properly, or they fragment memory
which is then not released after they are closed, I think. I'm not
a programmer - perhaps someone who is can explain better.

Message-ID: <M0b_a.113$612.1474@dfw-service2.ext.raytheon.com>
Source record: 24663

This is for Didier Mï¿½quignon and Laurent Favard
(I see Didier posting here, but Laurent seems to have
disappeared):

I appreciate the Eiffel project, and the fact that it
is "open". Well, at least the hardware is "open". I
would be very pleased if the source for the PIC program
were available. Is it possible to put it on the web
page, or get it for the asking (assuming I can get a
good email address)? In addition to building an Eiffel
for a C-Lab Falcon (which I don't need the source), I
have in mind a similar project for the TI-99/4A (for
which source would be a great help).

Or the cnf itself, could be made clearer. In Unix where lotsa cnf files
are to ber editet manualy, they use full names with explanations, something
like this (excerpt from mint.cnf):

```
<snip>
#-------------------------------------------------
# VARIABLES DESCRIPTIONS AND SETTINGS
#-------------------------------------------------

# SECURELEVEL= enables the appropriate security level:
# 0 - recommended for single user setups, like MultiTOS (default).
# 1 - recommended for multiuser setups, like KGMD.
# 2 - full protection, unsupported by software, thus discouraged.

SECURELEVEL=1

# FASTLOAD=YES forces fast loading (without zeroing all the memory)
# for all programs. This defines a default state, that can be modified
# later via appropriate kernel calls (use MiNT Setter utility to
# toggle it later when neessary, without reboots).
# FASTLOAD=NO means that the information from the program header will be
# used to decide (this is like TOS does).

FASTLOAD=YES

# NEWFATFS= enables the new FAT filesystem driver for selected FAT
# filesystems. The old TOS FS will be used otherwise.

#NEWFATFS=A,B,C,D,E,F,G,H,I,J,K,L,M,N,O,P,Q,R,S,T,V,W,X,Y,Z
NEWFATFS=A,B,C,D,G,H,J,K,N
<snip>
```

Its a lot easier to edit such config files. No need to peek into docs
etc, except for some more precise explanations...

Janez

P.S: maybe some docs with explanations on Web wouldnt be bad, the interested ppl can easily add comments into cfg file by themselves for later usage?

R>What version of the NOVA VDI are you using? Before or after Gehard
R>modified the code for the AB?

Gerhard was so kind to send me any of the NOVA VDIs that exist. None of them work.

R> Also remember the patch that Doug wrote that most of us applied to AB
R>software. Did you go back and try 030 and 040 non-patched versions?

As above mentioned I tried every version. :-(

R>I have a GEM utility for the Expose I can capture and play back under
R>the NOVD VDI, but no editing. It is wrote in HiSoft basic.

Could you send this to me? (Please use my other email-address: f.szymanski@dmt.de)

R>My old ScreenEye softs would capture under NOVA VDI, but color palette
R>was not correct. Captured file was ok, had to edit under VIDEL to view
R>properly.

Mine works under NOVA as well. :-)

R>Does Funmedia work under the NOVA?

Yes, it does, although not quite stable. :-(

Hi Martin,

>Does anyone know/remember/have/use/sell CompoScript ?
>It was/is a Postscript interpreter for Atari. Something like Ghostscript I
>guess, but commercial and maybe more user friendly.

Yep...
I know/remember/have and still use it. It's a postcript interpreter which
beats the shit out of Ghostscript. But it can only interprete postscript,
not Acrobat. It comes with a nice gui and printing is a dream...
It's probably one of the most underrated applications on this platform.

Cheers from Belgium

Based on the offers you gotten in this thread, I'd say there IS a
market.
At this point I'd also like to add that I'm interested in either of
them as long as they have midi ports.
I have an STe back home in Scotland (part of a home studio), but have
had to survive without since I moved to the states for my studies. A

portable atari system would be a dream come true.
On a side note - if anyone can tell me how to get my hands on a
Falcon, please drop me a line. I haven't seen any on eBay. Ever.

That's nearly correct. An easy-to-fix-but-uncaught bug made the game
work only on 1 MB systems. Installing an auto program to take up all
but 1 MB makes the game run on other systems, including my 4MB STe and
14MB Falcon.

Prices at those stores are kind of excessive dont you think?

5494. Megafile 30 Bad?

Newsgroup: comp.sys.atari.st
Date: 2003-08-13 04:23:35 UTC
From: swampfax1@atlantic.net
Message-ID: <b3j_a.108$if4.51422@newshog.newsread.com>
Source record: 24674

Hi All,
I'm trying to boot a Megafile 30 on my Mega4. I let it spin up
and run AHDI from the floppy but I get a message saying "ID unavailble"
"not bootloaded".
So, even though I have'nt set it to boot from drive C shouldn't I have
access to the 4 partitions that were there? The odd part is that after
installing a drive icon (C for example) and opening it I get the message
that the drive does not exist but after hitting cancel, a window opens with
the drives contents! Is the Megafile just about dead or have I missed
an installation part? Then that after playing around with it the floppy no
longer reads it's disk contents! Please don't tell me the Mega is having
problems /:)

Hi Owen,

if you don't mind to send it over-sea check out eBay.DE. There have been 3 Falcon's in a row, each within the range of 160-200 Euro (1 Euro ~ $1.1). Even with shipping thats by far cheaper than the suggested dealers. If you need help with a description just drop me a mail. At the moment there aren't any but this Link will get you straight to the search results for an Falcon. No need to struggle with german.

http://search.ebay.de/search/search.dll?MfcISAPICommand=GetResult&query=falcon&categoryid=&ebaytag1code=77&ht=1&st=2&category2=23193&SortProperty=MetaEndSort&shortcut=4&from=R2&catref=C3

The latest and last version of Texel is 2.20, but there are some issues with compatibility with number formats and CSVs. Anyway, there is a patch program and all the necessary files including ST-Guide hypertext in English to turn this German-only program into English on my website.

Emailer is intuitive in operation and is quick and easy to set up; for me
its only failing is insisting on using encoding instead of plain text for
emails. Many mailing lists reject these and so one must visit the outgoing
message folder with a text editor to change the headers :-(

From: mail@freeman-studio.com (Mike Freeman)
Date: 12 Aug 2003 11:05:36 -0700

Hi Mike,

>> What about 'time slice'?
>
>That's all fine and good, but how would one know that disabling this
>"Time Slice" variable would turn off pre-emptive multitasking and turn
>on cooperative? They don't exactly make it obvious, is my point.

They don't have to, normally the TSL variable is set from within the MagiC config CPX. Note that disabling TSL switches MagiC into singletasking mode, not coorporative multitasking. MagiC knows pre-emptive and single task. Disable the TSL variable when during boot MagiC hangs or crashes. If however nothing like this occurs on your system then it's not necessary to disable it. The first value represents the time slice. The second value represents the background priority.
The MagiC config program which is included with MagiC 6.20, should be more then sufficient for 95% of the MagiC users to configure MagiC. If you like to edit it yourself, the HYP file that comes with the configurator should enlighten you...

Cheers from Belgium
Dennis

From: Janez Valant <swe@atari.org>
Date: Tue, 12 Aug 2003 21:36:57 +0200

Hi Janez,

>>Or the cnf itself, could be made clearer. In Unix where lotsa cnf files
>>are to ber editet manualy, they use full names with explanations,
>>something like this (excerpt from mint.cnf):

The magx.inf file *IS* sufficiently documented. All what people need to do
is look in the MAGIC/XTENSION folder at the magx.inf example file and *read*

it. And for the non believers, here's an example.

```
; Example Configuration file for MagiC 6.20
; ========================================
;
; ï¿½ Andreas Kromke 1990-2002

; This version of a commented MAGX.INF file is fully functioning.
; It provides full explanation of any settings for manipulation.
;
; For normal application, the configuration performed on installation
; will suffice completely. This file should be of interest to the
; advanced user only. It provides assistance for stepwise understanding
; of these settings (e.g. for evaluation by your own programs) - but,
; what is more, you can make modifications directly, in particular those
; difficult or even impossible to make from within MAGXDESK.

============================================
; First the version number of the OS that saved this file

#_MAG MAG!X V6.20

; Now the sections
; first the section evaluated on booting, i.e.
; before starting the AES

#[boot]
; The number of cookies can be determined,
; but at least 20 cookies will always be installed.
cookies=20
; The log file redirects the BIOS output of the AUTO folder.
; You can also put u:\dev\null here in order to suppress
; the output completely.
log=c:\boot.log
; Before executing the AUTO folder, you can tile the screen...
```

```
tiles=C:\GEMSYS\GEMDESK\PAT\16\PAT28.IMG
; ...then draw a logo on the center of the screen...
image=C:\GEMSYS\GEMDESK\PAT\256\MAGIC.IMG

; definition of the BIOS devices
; Without changes in MAGX.INF there are some files in u:\dev
; missing. To compensate for this, additional lines in MAGX.INF
; are necessary. Here some examples, depending on the kind of hardware
; (remove leading semicolon to activate the appropriate ones):

;Atari ST:
;biosdev=3,u:\dev\midi
;biosdev=6,u:\dev\modem1

;Atari Mega-STE:
;biosdev=3,u:\dev\midi
;biosdev=6,u:\dev\modem1
;biosdev=7,u:\dev\modem2
;biosdev=8,u:\dev\serial2

;Atari TT:
;biosdev=3,u:\dev\midi
;biosdev=6,u:\dev\modem1
;biosdev=7,u:\dev\modem2
;biosdev=8,u:\dev\serial1
;biosdev=9,u:\dev\serial2

;Atari Falcon:
;biosdev=3,u:\dev\midi
;biosdev=6,u:\dev\modem1
;biosdev=7,u:\dev\lan

;Mac:
;(none)

;All GEMDOS standard files now can be redirected to arbitrary
;BIOS devices that are accessible via u:\dev
;con=u:\dev\console
;aux=u:\dev\modem
;prn=u:\dev\prn

; Now the section for the VFAT file system

#[vfat]
; This is the option for long file names.
drives=eh
#[aes]

; After the identification for the section [aes]
; the data for the AES.
;
; All lines relevant for the AES start with #_??? and come
; before the lines #[shelbuf] and #_CTR. The entry #_CTR only exists
```

```
; for reasons of compatibility.
; Other lines will be treated as comments.
; In general, all lines except for #_CTR and the following ones
; are optional - if they are missing, default values are put in.

; Now the variables for the environment. Since the strings are read
; to the end of line, you must not put any comment behind the #_ENV line.
; This is necessary in order to allow colons or blanks in the string
; for the environment.
; The environment transferred by BIOS will be used and transmitted
; by AES if, and only if, no #_ENV line has been specified.

#_ENV HOME=C:\GEMSYS\HOME\
#_ENV PATH=C:\BIN\;A:\
#_ENV PROMPT=$p$g
#_ENV F1=qed

; You can load arbitrarily many SharedLibraries. They are loaded
; on starting AES and will be released on termination of AES or change
; of resolution.
; Some of them (WINFRAME) change attributes of AES (quasi system
; extension), others (PDLG, EDITOBJC) can be "stocked",
; i.e., if a program calls Slbopen(), the libraries don't have
; to be reloaded again. This is useful if you have suficient memory
; and/or a slow disk medium (reloading of an SLB takes some time).

#_SLB 0 WINFRAME.SLB
#_SLB 0 PDLG.SLB

; The size of the shell buffer must be variable so that any shell
; can store its data there. At least 8192 bytes are always reserved
; anyway, and your number must not exceed 65535. You can get the
; size of the buffer (an unsigned int) by calling shel_get() with 0 bytes
; to read. If the size of the buffer is insufficient, there won't
; be a crash, but the shell won't be able to store all of its data.

#_BUF 16000 ; size of the shell buffer, decimal

; The device number will not be evaluated if the system is being
; restarted for a change of resolution. If, on opening the
; work station, (N)VDI returns an error code (Handle 0), the VDI
; will be restarted with device number 1 (current resolution).
; The usual resolutions of ST/TT are
; 2 = ST low, 3 = ST medium, 4 = ST high
; 6 = TT medium, 8 = TT high, 9 = TT low,
; higher numbers depend on the device drivers (MGE,VGA,...)
; specified in ASSIGN.SYS.
; The Falcon requires an additional number describing the resolution
; (mode code), this is specified after the VDI device number
; (from MagiC 4 on). Usually, the first number for the Falcon,
; the VDI device number, is "5", the resolution is specified by
; the "mode code" only.
```

```
; Specification of the "mode code" is mandatory - if no Falcon is used,
; it is "0".

#_DEV 4 0 ; VDI driver, 4 = high resolution

; The dimensions of a resource unit can be defined independently from
; the big AES font, from Magic 5.20 on. In order to guarantee high
; compability with applications, you should, in particular when using
; vector fonts, determine a fixed raster of 8*16.
; Syntax: #_OBS <horiz.Raster> <vertic.Raster> 0 0

;#_OBS 8 16 0 0

; Font ID and font height can be specified separately for the small
; and large AES font, from MagiC 5.20 on. You do have to specify
; whether your font is proportional or monospaced. Proportional
; fonts work from MagiC 6 on.
; Syntax
; for the big font: #_TXB <fontID> <monoFlag> <pixelHeight>
; for the small font: #_TXS <fontID> <monoFlag> <pixelHeight>

;#_TXB 1 1 6
;#_TXS 1 1 4

; With the following setting you can change the format of the INFO
; line in all windows:
; lineh height of line. "0" means standard height.
; fontID font ID for the INFO line. "0" means: the same font
; as for the big AES text
; monoFlag 1 (monospaced) or 0 (proportional)
; fontH font height for vst_height()

;#_INW lineh fontID monoFlag fontH

; Here you can specify parameters influencing the look of MagiC:
;
; Bit 0: The MagiC logo is placed on the left (1) or on
; the right (0) of the menu bar.
; Bit 1: The 3D-effects on using at least 16 colours are switched
; on (0) or off (1).
; Bit 2: The backdrop button is drawn (0) or isn't (1). If there isn't
; a backdrop button, you must click the window title bar in
; order to drop a window on the lowest background level.
; Bit 3: Use the MagiC 4 window title, i.e. with lines (0), or draw
; the traditional fill pattern (1).
; Bit 4: If bit 3 is 0 (and thus the MagiC 4 window titles are
; activated), you can determine whether the window name should
; appear in 3D look (0) or normally (1).
; Bit 5: If this bit is 1, the meaning of the Ctrl key is inverted
; on scrolling the window, i.e., real time scrolling is
; switched off by default.
; Bit 6: Ditto for real time resizing or moving
; Bit 7: (from MagiC 6.00 on): switches on 3D menus. This only works
```

```
; with proportional big AES font.
;
; All flags that are not explicitly specified are assumed to be 0.

#_FLG 0 ; Bit 0 = 1: Logo on the left

; With this entry, one can choose colour and fill pattern of
; the background of the default desktop. Specify a number <num>.
; <num> = 120 (== 0x78) yields a light grey. 0x70 is the fill pattern
; (7 = totally filled) and 8 the colour. Thus the code corresponds
; to a value specifying the look of a filled rectangle of the AES
; object G_BOX.

#_BKG 120

; Here one can specify the maximum number of windows. Valid values
; are between 0 and 64, you shouldn't use a value < 16. Missing
; specifications are assumed to be 16.
; Hint: when using MGNOTICE, enter at least 30.

#_WND 32

; Here one controls the distribution of CPU time between foreground
; and background processes. The fist value yields the length of a
; time slice in multiples of 5 ms, the second the background
; priority: "32" means a priority of 1:32 for background processes.
; If any specification is missing, preemptive multitasking is
; deactivated.
; In order to avoid conflicts caused by concurrent memory requests
; by several autostart programs and accessories during the boot
; process with activated background DMA (Atari) or asynchronous
; disk access (Mac), this line should be omitted and preemptive
; multitasking should be activated in the TSLICE.CPX instead.

;#_TSL 1 32

; The Scrap-path ("Clipboard") should always indicate an existing
; directory, else it is undefined.

#_SCP C:\GEMSYS\GEMSCRAP\ ; Scrap directory

; Here one can make specifications regarding the "file selector".
; First comes a flag - which at time is ignored and should
; therefore always be zero - followed by a string of possible file
; types, separated by ";". Double patterns are separated by ","
; ( e.g. "*.PRG,*.APP" or "*.JPG,*.JPEG").

#_FSL 0 *.C;*.H;*.S;*.APP,*.PRG,*.TTP,*.TOS

; The following line contains the program and its complete path
; that performs the redirection of TOS programs in windows.
; When starting the first TOS program, this program will be started
; automatically if it hasn't been loaded.
```

```
#_TRM C:\GEMSYS\GEMDESK\VT52.PRG

; This line specifies the path accessories are loaded from.
; If none is found, none is loaded. If this line is omitted, the
; current directory of the boot drive is used, in general this is
; the root directory.

#_ACC C:\GEMSYS\MAGIC\ACCS\ ; path for ACCs

; If there is a #_APP-line, applications can be loaded before
; starting the default shell. These will be available parallelly
; to all other programs immediately. This is an alternative to
; the old accessory concept, since they can be removed from
; the memory again, which those couldn't. Only programs with
; adequate memory requirements are eligible - if you load
; WORDPLUS this way, you won't be able to load any other
; program (if you haven't limited memory allocation by LIMITMEM).
; All programs are started in graphics mode.

#_APP C:\GEMSYS\MAGIC\START ; path for parallelly loaded APPs

; With #_AUT you can start an application automatically as with
; TOS 1.4. The difference to those specified under #_APP is the
; following: the application specified under #_AUT is not started
; in parallel but instead of the desktop or the default shell.
; Only when the application is finished - and has not determined
; any successor by shel_write() - the desktop or the default shell
; is started. (this is useful for a login prg in networks!)
; The application is always started in graphics mode.

;#_AUT C:\LOGIN.PRG

; The default shell is started only after any program specified
; in #_AUT. Without specification, MAGXDESK is started.
; Desktop or default shell are always started in graphics mode.

;#_SHL C:\KAOSDESK\KAOSDESK.PRG ; Shell

; The AES section finishes with the next section, thus, in general, with

#[shelbuf]

; The listing of the MagiC variables finishes with the line
; #_CTR, indicating that the subsequent data will be
; transferred directly into the shell buffer, namely the
; data for the (old) control panel (this means that XCONTROL
; doesn't use them) and the data for the desktop.
; The lines for the desktop start with 128 bytes after #a,
; the first line is #_DSK. (the 128 bytes present an old TOS
; convention).
; It is important that the length of line #d is such that
; the total length of the control panel data is exactly
; 128 bytes. Since some editors remove trailing blanks
; (this can also lead to errors with the environment variables,
; we finish the line with a ";" instead of a blank.
```

```
#_CTR ; Start of data for the control panel
#a000000
#b001001
#c77700070006000700552005055522207705570750555077031113 02
#d ;
#_DSK MAGXDESK V4.00 1 ; Start of the shell data
```

==========

>P.S: maybe some docs with explanations on Web wouldnt be bad, the
>interested ppl can easily add comments into cfg file by themselves for
>later usage?

As you've seen now for yourself there's no need for this, every possible command is covered and explained already. And then ofcourse there are still the MagiC programmer docs, which go through great length explaining every command in detail. Peter West shed lots of sweat and energy translating the whole lot, it would be nice knowing that someone somewhere actually reads them instead of complaining about the lack of documentation...

Cheers from Belgium
Dennis

5503. How to find a Falcon on Ebay

Newsgroup: comp.sys.atari.st
Date: 2003-08-13 11:13:43 UTC
From: Jean-Marie de Boer <JM-at-complicated-dot-net>
Message-ID: <s47kjv4f5oitidvam7mvefm4n54ddcpitd@4ax.com>
Source record: 24679

Since I read several posts with this question, a tip:
Register for ebay. You can then add a 'favourite search'. Just use
'Atari Falcon' as the search term. You can have the site send you a
mail when one becomes available. This way you won't miss it.

There is one up for auction now!

JM

Correct. There is no -12V on the Falcon and the Nova doesn't require
it either. Just connect the +12V.

Jo Even

No, I am not sure about -12V. I only know that there are two cables on
the adaptor and the manual says that you have to connect both cables.
With +12V and -12V it worked with my Falcon (with afterburner) but I
didn't try without -12V.

Well, obviously your Mega is having problems, or you wouldn't be
positing this :)

> Hi All,
> I'm trying to boot a Megafile 30 on my Mega4. I let it spin up
> and run AHDI from the floppy but I get a message saying "ID unavailble"
> "not bootloaded".

How long has it been since you've used the system? I've heard of
similar stuff happening when people haven't used the system for a long
time, or have just moved. It sounds like a flaky connection either
inside the Mega, or the drive. I would suggest opening up the Mega
and gently pushing down on the socketed chips on the board. What
clued me into this is that you said the floppy drive had a problem
after the Hard Disk when wrong. Reseating/pushing down on the chips
should fix both problems, if that is the problem.

> So, even though I have'nt set it to boot from drive C shouldn't I have

Again, sounds like a flaky connection somewhere. Don't forget to
check cable connections while you have it open.

Where did you find -12V? Directly from a AT PSU? There is no -12V on the
Falcon motherboard, I used my Nova all the time with just +12V
connected. Also, there was no +12V on my Nova adapter.

It would be a very good idea to use a text editor, some of the GUI's are not
aware of some of the newer commands.

>However, I feel really uncomfortable changing things when I have no idea
what
> most of it means.

Most of it is self explanatory.

The font fiddlies and object doohikies are a major black art!.

>

Okay.... I'm not alone here. MagiC *can* run for a long time for me
stable, but in practice it does NOT. MiNT on the other hand will very
occaisionally hang up but it's usually when I run a very naughty
application. As a general rule, moving about the system MiNT will NOT
CRASH EVER. MagiC has crashed on me numerous times copying files. If you
copy a drive to another drive, around 1gb of data or so, it screws up big
time.

The kind of applications I run under MagiC/MiNT include aFTP, CAB 2.8,
Highwire, Aniplay 2.21, HD-Driver 8.11, and Magxnet.

But you can't blame any one of these apps because I've tried alternatives
for each.

I can't accept this "configured wrong" argument. I run a network with 80
servers on it on a daily basis. I deal with bugged development
applications all the time. I know about computers and know how to fix
things. I've been over magx.inf many times. I've booted magic up with no
auto prgs, no desk acc, no slb, no anything and it still can crash after a
while. SOMETHING is inherently wrong with MagiC. Even the MagiC PC demo
OUT OF BOX installation CRASHED on me in the same way! I'm not crazy!
It does it on my Mega STe, it does it on my TT, and it does it on my
Falcon, and it is the SINGLE MOST ANNOYING thing I have ever experienced
;-)

The problem with MagiC and MiNT, is that with a conservative auto folder
and desk acc set. Say internet stuff, NVDI and COPS, if the system

crashes there is only one SINGLE item to blame it on. Magx.inf or
mint.cnf. That's it.

But okay. MagiC is supposed to have slightly better memory protection
than MiNT in unprotected mode. I never run MiNT in protected mode. Why?
Because it's stable enough as it is.

Look, I'm quite sure it's nothing I've been doing wrong. I've been
wrestling these problems for several versions of MagiC since I ever
started using it. If it works great for everyone else. That's really
good. But it *does* not work for me and I will not just say it, I'll
spray it because it pisses me off ;-) I feel like it was nothing but a
massive waste of money for me. Sorry.

>>And adding the option of having MiNT extensions would totally rock and make

>

Actually from what I understand, MagiC 6.20 has a lot of MiNT
functionality built in. This could be a load but it came from a rather
reputable source.

>>Unfortunately for everyone involved, MagiC is still LOADS faster than

MagiC is faster. What do we use atari for? The AES.. The windowing
system. It's the most important part of the machine, and nothing beats
MagiC's AES. Nothing.

>available.

Agreed. Actually this info was in the MagiC4 manual, under 'Manual
Configuration in MAGX.INF', but it's not in the MagiC 6.01 version
for some reason. However version 6.20 is accompanied by an example
configuration file for 6.20 by Andreas Kromke, in English, which
explains some of the new items.

If you're looking for them, I've a page that has a list of the commands
and a description for them. It's presently at:

<URL:http://www.my-ste.demon.co.uk/info/index.htm>

>I've been told by a few people that it is better to edit the file using
>a text editor rather than using one of the GUI-based configuration
>programs (is this correct?).

I can't say which way is better. I preferred to do the editing within a
text editor.

>However, I feel really uncomfortable changing things when I have no
>idea what most of it means.

Understandable.

>For example, I've heard this advice about turning off pre-emptive
>multitasking a number of times, but usually this advice comes with no
>explaination of how.

I'm guessing that the manuals for v6+ are rather lacking in this sort of
information.

>And TSL doesn't exactly scream out to me that it has anything to do
>with the multitasking mode used, so this wouldn't be the obvious choice
>if I were to guess.

This would be where the joys of experimenting comes in. And making sure
you have a backup :)

>There's also nothing about this in the meager 40-page leaflet that came
>with my English version of Magic 6.01 (passing itself off as a manual).

Looks like I'll be making a copy of my 5.1 manual before I upgrade to v6
:|

> So it would be nice if there was some sort of reference web page
>available (multi-lingual preferred, instead of just German). Is there?

There is a (very) limited one available now. URL is above :)

Hello,

What about Mario Becroft's Galaxy graphic card ?
I browse his site yesterday, and found that nothing was changed
since november of 2000, when the ethernet part wasn't ready.
And, it still isn't :-(
Did he abandon his project ? Or, does he intend to achieve it ?

Thanks,

J.-Luc

Well it really has that option, I've done it several times! What Papyrus
does is giving the textfile the extension .doc. Word can open it without any
problems. When you try to save it to your Windhoze computer, Word recognises
the file as RTF.

So it's a trick: an RTF file with extension DOC :)

Is there a place where I could still buy it ?
Is it copy protected (dongle or disk ?), or, if not, I would like to try a
copy of it.

I use Ghostscript now to print music scores that I create with abcm2ps.
The user interface however is horrible, even when using the GEMGS version.

And here u go again... I didnt complain, i just propose a solution i find
okay. I also used question mark on end, since it was just a proposal for a
problem. Problem exist, since ppl did ask for explanation.. But it seems, i
proposed Unix/MiNT like solution, or the method u dislike, so u couldnt
resist... So im apologising to even react on question and propose a
solution, how foolish of me.. Dennis forgive me such act.. o master...

What i need to do, not to trigger bad reaction from u.. Shutup and
vanish? I dont mind correction, i didnt know for magix/extension folder,
but u had to revert it into bad thing again... thanx

5524. HighWire 0.1.4 is released

Newsgroup: comp.sys.atari.st
Date: 2003-08-13 21:05:29 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.iqbrbqns@localhost>
Source record: 24603

Hi all,

Once again it is time for a new HighWire release. This time the code has had many vital additions and changes, some of which you'll notice right away but also some not so obvious. Above all, the implementation of online document caching means a very important step has been taken, as many upcoming additions will rely on it working. One example that is already working, is the ability to download and replay (via external players) embedded sounds from remote.

There have of course been a number of bugfixes made since last release, and some of the most important issues solved are:

* Downloader schedulers bug cured (job queue sometimes got messed up)
* History function bug cured (got messed up if a subframe document was located on another server than the frameset document) * One table bug resolved (table cells would overlap other objects on page)

Finally some cosmetical issues that are new with 0.1.4 release, some of them making HighWire looking slightly similiar to a real browser ;)

* Toolbar icon OPEN added (select local file to load and view)
* Toolbar icon STOP added, (cancel loading of the current page. ESC key does the same) * Ability to set the default background colour, in case such is not decided in BODY-tag

Do download and test this release! Future development will surely benefit from your feedback!

NOTE: Please make sure to carefully check out the example highwire configuration file for details on how to setup the cache as well as the default background colour.

WOW - the 3rd grade must've gotten an internet computer...you should REALLY
get back to your drawing before all the other kiddies finish before you
do...

Don't you mean "...there was no -12V on my Nova adapter"? Either way,
it's not correct. Looking at your Nova adapter, I see both + and -
12V pads. However, the -12V shows no signs of solder, whereas you
definately soldered a wire onto the +12V at one time.

>

Mario ran into some troubles with the Ethernet side of the card and posted a couple of years back that although he hadn't totally given up, he was losing interest in spending his free time solving the problem. Hence, I conclude that although he might get around to it someday, you should consider the Galaxy to be a graphics card with a couple of unused chips on it.

Disclaimer: I didn't research this thoroughly -- my memory is generally pretty good, but I have been known to recall incorrect information.

Thank you for your insight. I have been using a Mac for years and have always greatly preferred them to Win machines (which I also use). Until this thought provoking post I always thought Mac was just better. Now I see the error in my ways.

Thanks. My life has been changed for the better due to your knowledge.

I do everything on my Mac as I did on the PeeCee, only without viruses,
worms, Trojan horses, Blue Screens of Death, XPee activation codes,
Palladium, Bill Gates' high falooting attitude, etc. By the way, I can do
things better on my Mac.

Well, when a newspaper runs an advertisement for a Macintosh Operator,
they are not looking for someone who knows where the power switch is.
They are looking for people who know how to use programs used for setting
newspaper advertisements, which do not run, or do not run well, on any
other platform, although Atari has a good one of those.

It seems that the timing requiremts for a GUI were sorted out around 1984,
and forgotten by everyone but Atari and some models of Macintosh.

One has to be pretty thick to not notice bad timing in MicroSlop products.
It has been noted that Microsoft products will all suck until they start
making vacuum cleaners.

It's not so much "what" as it is "how."

I can do anything with my Mac that you can do with your PC, but I can do
it without:

Daily security patches
Weekly Viruses and Worms
Microsoft 'Spy Ware'
WindBlows operating system.
And therein lies all the difference I need. And who the fuck are you to
come here and try to tell me that I'm wrong?

> Throw away this shit and buy a PC !

The reason we use our computers comes down to "preference". No one is the same and no one perfers everything the same as other. This would be an awfully boring world. I enjoy the Commodore for my personal reasons. I loved a game called ACE2. Had a wonderful tune by Rob Hubbard. It is all about the fun and enjoyment. I hate to say a PC is not fun but in certain things the Commodore is funner than a PC. I enjoy its simplistic nature. Colors isn't everything but alot of colors down in simplistic and elegant ways helps make me relax.

Seeing the same kind of stuff that looks the same or similar all the time is boring and tiresome not relaxing and not enjoyable.

This may be spoken for "ALL" platforms. Those BSODs and viruses and lockups that some computers have often is extremely annoying and stressful. That is why after hours dealing with stuff like that, some go home and relax and enjoy themselves (even on classic computers like the Commodore 64 which reminds people of simpler days).

Please stop posting messages with the intent to piss people off. I personally do not care about your life problems but try to be better than that. Take that old Nintendo, Sega Genesis or classic computer and play a fun little game or play your shootem' up game which you do nothing but shoot with no "game story". I think you need some diversity in your life.

www.macvirus.com is a site with Mac related virus information. They do
exist on the Mac whether you have experienced them or not.

Trojans - http://members.fortunecity.com/reapers_virii/trojans.html
here you will find quite a few. They also exist.

FIXING YOUR MAC - Solving Common Mac ERRORS -
http://www.macforce.com/support_cure.php - well I guess Macs have
errors like any other computer.

So you never really went into specifics. What can YOU do that I
cannot? What can you do better on your Mac? How many times must I ask
this?

Every newspaper uses Mac? Interesting. What is the name of this
program? I am interested in researching this. It sounds like a
farse...

I addressed the virus and worm issue. They do exist on the Macintosh.
It's your own platform and it's funny how you apparently were not
aware of them.

I never said you were wrong. YOU have an obvious anger management
issue. Is that how you react when someone asks you a non-threatening
question? You have a real problem.

Someone mentioned something to the extent that the Mac could do more
and I only asked what a Mac can do that a windows based pc cannot. I
am sorry it's such a touchy subject for you...

Did I hurt your feelings?

Daily security patches
Weekly Viruses and Worms
Microsoft 'Spy Ware'
WindBlows operating system.
And therein lies all the difference I need. And who the fuck are you
to
come here and try to tell me that I'm wrong?

You better tell George ^^^^^^^^ he would be well suited on a Windows
based computer going by your text below.

Why are the Macintosh users in here so nasty? What happened to the
peaceful, artistic, understanding Macintosh users?

Actaully they don't. not on OSX anyway. OTOH, there are literally
THOUSANDS of Wincrap viruses and worms however.

> I never said you were wrong. YOU have an obvious anger management
> issue. Is that how you react when someone asks you a non-threatening
> question? You have a real problem.

My anger managment problem is that I no longer have any tolerance for
Wintrolls. I don't go to Windows groups screaming that Windows is crap,
why do you jerks come here? Are you so unsure that your choice of
platform is best, that you have to bait people using other platforms
just to make yourself feel superior? The very fact that Wintroll post
here yell me that it's YOU that has the problems!

Not hardly.

You Wintrolls come here to this group to tell me that my choice of
computer is a piece of shit and then expect civility from me? Think
again, please!

I don't know who said this but it's not true. Not EVERY newspaper uses
Macs but MOST Newspapers do (heck, most publishing is done on Macs)
running QuarkXpress because PC fonts are non-standard and have no true
ligatures. Macs also have more reliable PostScript support than do
Windows machines, but it is possible to publish with Windows, it's just
more work for less professional looking results, that's all.

love how "macvirus.com" hasn't needed an update since Jan 2001...

no viruses here... mac users are wanting a virus... oh please!!! too bad
the os doesn't allow for them... so sad...

We can get our work done instead of working to get the PC to work. ;)

But seriously, it's not *what* we can do on the mac, it's *how* we can
do it. BMWs and Ladas will both get you where you want to go.

For instance, OS X has apparently *finally* gotten it's first virus:

http://www.lowendmac.com/lite/03/0813.html

But unlike Blaster: "Whatever, the Switchback virus exists, and it's
spreading like molasses in January."

This list is not complete, at least the variables introduced with 6.20
are missing. The commented magx.inf that comes with the MagiC program
is the reference.

I remember that there was a (freeware?) program to manipulate the
"magx.inf" file, but I do not know if this one supports the latest
MagiC version.

I use a 10 year old Mac, running System 7.1 at a whopping 25MHz. It came equipped with a DSP on the motherboard, so I can record and edit CD quality stereo sound, record and edit video, use voice commands, connect to an Ethernet network without any additional computer hardware than what came out of the box from Apple.

Now, I have no idea how new your computer is...maybe it CAN do all this???

Now, ready, set, go and Google all that...

Then, you'll come back and tell me I could have all this on a (insert brand name here) PC for less money, but, I won't care because...

I've had no hardware failures. Only maintenance was the PRAM/clock battery which needed to be replaced twice and upping the RAM to run more newer web browsers (MacWeb anyone?). I had no problems with any Y2K stuff, and although you found evidence of Mac virii, etc. I've yet to have one in the 9.5 years I've been online.

The advantage to using this Mac is that it works. People I know who use PC's have not been so lucky. I'd rather get work done than deal with bloated, inefficient software, and often substandard hardware.

Of course there is both -12V and +12V on the Falcon mainboard. There
were 2 wires on my NOVA adaptor a red one and a black one. Both had to
be connected to the Falcon mainboard.

I have to take a closer look into the manual of my NOVA if you are
interested.

So what's wrong with copying the fully-documented version of magx.inf over
the cut-down one that you have a problem with?

Where does -12V come from? Not from the PSU, that's for sure.

> were 2 wires on my NOVA adaptor a red one and a black one. Both had to
> be connected to the Falcon mainboard.

Hmm... Are you sure that the black one isn't ground and not -12V?

> I have to take a closer look into the manual of my NOVA if you are
> interested.

Yes, that would be interesting. It's possible that you have a different version/revision of the adapter than me. But my Nova definitely only had one wire, and that was for +12V which isn't available on the Falcon expansion bus.

> time.

Unfortunately I have not been using Atari hardware for several years now, and so I cannot tell much about the stability of MagiC on "old" hardware, but with "modern" applications and network. But from my long year experiences I can tell the following:

1.

MagiC on Atari hardware reacts much more critical with hardware problems than TOS/MiNT do. No wonder, because Atari computers were shipped with TOS ROMs, and MiNT usually uses the ROM BIOS. If that BIOS does not work, the computer is supposed to be dead. MagiC comes with its own BIOS, and it usually uses asynchrounous DMA transfers. The first Atari TT I used for development tended to freeze when MagiC's BIOS accessed the SCSI registers. I wasted a lot of time finding the problem that turned out to be hardware related. A new TT (in fact a much, much older one) then worked fine.

2.

The last years of MagiC development on Atari hardware I was using an old TT. In several years I never had any (!) crash, so in practice MagiC on Atari was more stable than Win95. But, of course, I had my set of well behaving applications that were not very hardware related. The same is partially true for MagiCMac and totally true for MagicMacX. The MagiC kernel itself is proven to be very stable, at least with "standard" applications.

3.

Of course MiNT should be much more stable than MagiC, because of its memory protection. Any wrong behaving program can crash MagiC at any time. This is a really big disadvantage of MagiC, und therefore only applications should be used that turned out to be stable.

4.

> The kind of applications I run under MagiC/MiNT include aFTP, CAB 2.8,
> Highwire, Aniplay 2.21, HD-Driver 8.11, and Magxnet.

Here the problem might be. Except Hddriver I have never use any of these applications. It might be that either one of your applications has bugs, or MagiC has bugs that only cause problems with "modern" applications/drivers that make use of features no older applications ever used. What about the stack size? Unfortunately I cannot remember if this was settable in "magx.inf". Maybe the stack size has to be increased to avoid "AES stack overflow" messages.

5.

Regarding the MiNT API: When I created MagiC 5 I tried to support as many MiNT calls as possible. With versions 6 up to 6.20 more and more calls were supported. Unfortunately new features were intruduced to MiNT much quicker than it was possible to rebuild them in MagiC. And many calls like the TTY things would have been very time consuming to port, so that I have never supported them. Too much effort for too little (or no at all) gain, and a single persion cannot compete with a team of worldwide developers working on an open source project.

6.

Regarding open source: As long as I am maintaining MagicMacX, MagiC will not going to be open source. Further, it is unlikely to become open source later, because the source code is nearly 100% assembler und hardly understandable.

7.

Conclusion:

Ten years ago I now would have asked my beta testers about their experiences with magxnet and the above mentioned applications. I would also have installed these drivers/applications and would have created long tests with various configurations. Unfortunately I now do not have the hardware, not the time, no beta testers, and nobody would ever pay me for that work.

So, if problems occur now, the "non-MacOSX"-MagiC users must be either able to find or at least reproduce the problem for themselves. If a suitable bug fix can be derived, I then would be glad to create an update (MagiC 6.20++). But there is not much more I can do, e.g. I will not install and test magxnet.

If one cannot find the problem, he or she is free to use MiNT instead. It surely has advantages over MagiC, is free and open source, and (perhaps?) it is still being maintained.

http://BensCatalogs.Atari.org Link to 8 newly updated Atari Catalogs!

Due to Popular Demand, I'm extending my Christmas in July into August!
This is how it works. Buy the HardWare/Accessories for any Classic Atari
8 Bit and/or 16/32 Bit Atari ST System and I'll outfit your system with
Games/SoftWare and/or Books/References. You be good to me and I'll be good
to you! The more you spend on HardWare/Accessories, the better I outfit
your system. The more HardWare you buy for your system, the more Software/
Games and/or Books/References you receive! You choose the Atari Hardware
you want to buy and You & I choose the Books/References and/or Software/
Games I'll include in your Order.This will be a good opportunity to renew
lost interest in collecting Atari or building a New Atari system for the
first time. ReLive your Atari Youth! Call Ben anytime at (503)256-9974!!!

I cut and pasted the test below from www.quark.com :

QuarkXPress General FAQ

What is QuarkXPress?

QuarkXPressT software is an easy-to-use, integrated page layout
publishing package. Its powerful interface lets you combine writing,
editing, and typography with color and pictures to produce final paper
output, film output, or Web pages.

QuarkXPress 6 is available for Mac OS X v10.2, Windows XP, and Windows
2000.

This reminds me of the Macintosh fans years ago using their photoshop
argument to try and convince everyone of the superiority of the
platform based on a couple pieces of software.

Fortunately for the Windows users photo Photoshop and Quark are
available on the PC so I don't think the Quark argument is even worth
mentioning. I don't think the original Mac poster knew that.

Here's an interesting article to read -

Some Atari floppy games are installable on a HD, but most are not.
If you want to play a good that is try Amberstar or most any
Sierra Online games (King's Quest, Leisure Suit Larry).

For the rest of your questions, try Best Electronics. They sell
everything and anything for the Atari line of computers. Their
website is : http://www.best-electronics-ca.com/

Yes you do. On my Hades060 Doom and other ID games play nice. The
only problem I have is that the game crashes about 5-10 minutes of
play.

From: "Edward S. Baiz Jr." <edbaizjr@comcast.net>
Message-ID: <3f3b375816b9fa9@comcast.net>
Source record: 24567

Hello all,

Well I thought things all well and good with Gemvelope, but now I have run into a little snag. At first thing were fine, but now I am getting some weird printing results. First of all I need to have the NVDI driver for my Epson Photo 700 printer set to 360dpi draft. I know it sounds strange, but the resulting print is nice and dark like it should be. If I use the 360dpi Normal mode, the result print is too light. I am thinking that the program is too old and needs an update inorder to print correctly using NVDI.

Like I said things were find at first, now when I print using the 360dpi draft mode, Gemvelope does not print the complete address. It only prints every other line. If I use the Normal mode, then it prints everything. What I am doing is running the envelope through twice which gives me a good result.

I was just wondering if anyone had any ideas. I emailed the author and he said that he does not even own an Atari system anymore.

5589. 3.5" DSDD diskettes

Newsgroup: comp.sys.atari.st
Date: 2003-08-14 14:31:39 UTC
From: "Glen G." <glenatacme@aol.com>
Message-ID: <01c36270$a4029e00$6c8f4f3f@thegoodw>
Source record: 24570

Hi --

I have a number of old computers which require 3.5" DSDD diskettes and recently had an opportunity to purchase some of them (more than I will ever use, but I had to purchase the entire lot). A friend suggested that I post to a few Usenet groups pertaining to machines which have the same requirements -- somebody else probably could use some of these, too.

Here are the details:

Retail 10-diskette boxes, Certron brand, shrinkwrapped, inner plastic sleeve, labels included. Look and act just like brand new. I opened a couple of boxes and formatted half a dozen diskettes without incident.

They're packed in a couple of different-sized cartons: 10-box and 42-box. The 10-box cartons weigh 4 pounds, while the 42-boxers weigh 22 pounds. I'm in Orlando, Florida, zip code 32810, USA, if you want to get some idea of the shipping cost. I'd prefer to ship by UPS but will send by USPS if requested. Cost: $1 per 10-diskette box, minimum 10-box order (one 10-box carton).

I'll ship them from my company address, so I can accept VISA, MasterCard, American Express, or Discover. If you have another payment option in mind, please let me know.

If you want in on this deal, please send a note to glenatacme@aol.com or acme@ao.net. I'll reply privately and if you're in the USA I'll include my toll-free number so you can call and we can discuss the details.

BTW I'll be happy to ship internationally.

Any questions drop me a note at one of the addresses mentioned above.

Later --

Hrmm.. I believe I used magxboot on the mega ste and magxbo32.prg on the
TT and Falcon. I've tried others. On the Falcon now I must use the CT60
magxboot.

Thanks,
Mark

It's not a problem. I know a crasy people who prefer write bigs programs
(binary more than 600KB) in 100% assembler.

5595. Stop fighting about MiNT vs MagiC

Newsgroup: comp.sys.atari.st
Date: 2003-08-14 15:34:31 UTC
From: julianwolfe@earthlink.net
Message-ID: <de454671.0308140734.3ba8c2d6@posting.google.com>
Source record: 24576

Okay, I don't post very often, but I think I have a right to complain at this point because I *am* active in giving feedback to Atari developers;

To those of you who wish to fight about MiNT vs MagiC, realize a few facts here, regardless of what you prefer:

- MagiC is a commercial product, one of the few left for Atari systems. The less commercial developers we have, the more our community shrinks. This is bad, no matter which side of the fence you're on.

- Magic runs on 68000 machines, and MiNT does not. This is a problem, as there are MANY 68000 users out there who still use Atari on an everyday basis. I am one of those...I have a Mega/STE with 4MB RAM, and I run MagiC/NVDI. I don't have a choice. Deny MagiC users a say in things, and your community shrinks again. And again, a bad thing.

- MiNT is a wonderful OS. It does many things that MagiC does not. It's stable, regardless of what many people say, and the fact is, it's updated a helluva lot more often. It IS compatible with most GEM apps.

- Atari hardware is as varied as there are numbers of Atari systems out there. Your system may work better with MagiC or MiNT or whatever, and it might just be the hardware. I've had one falcon blow up all the time running MiNT, and onther runs fine...and vice versa with MagiC. It was documented that there were at least 3 revisions of the TT030 board during its production, so this is not a surprising fact.

My point in all of this is that we can't let this separate us as a community...it only makes people who really don't care about what you're running leave the Atari scene that much faster, if all they see is fighting.

Anyways...peace, Atarians!

-Julian Wolfe,

Suburban Chicago ATarians, Illinois USA

You know, Ben, you really should take some business classes and learn
better advertising. All you're doing here is pissing people
off...it's sort of like having popups on Usenet. Also, you really
need to take PayPal if you're running a web business. It's essential
these days.

Oh, your web site really could use a redesign too...perhaps an online
ordering system of some kind?

Honestly, these are only some of several reasons why I have not done
business with you in the past. If you stop/fix some of these things,
perhaps I (and others) will see you as a viable Atari source in the
future.

I think the main problem is that, due to piracy, many commercial
games used some form of protection on the floppy, which can't
easily be copied to the hard drive. (Many games don't have a
normal directory sector, and others use strange formatting which
normal copy processes won't handle). With games that use password
references in the manual or similar, as well as cracked or
unprotected games, OTOH, they should mostly run off a hard drive,
I believe - certainly I have some that do.

Hi

I have been thinking of selling this for a while now, so here goes...
I have a 4MB Atari Falcon for sale, comes with the following:

Multisync monitor
Box of floppies (backups, games, software etc)
A few items of boxed utility software, TruePaint etc and games
Videlity (resolution enhancer), NVDI accelerater, BlowUp, and other
goodies
540MB external Quantum Fireball hard drive + scsi lead
500MB internal hard drive
Mouse, jaguar joypad, joystick

Aside from the internal hard drive and external devices, this falcon
has not been upgraded.

It's been a while since I used it properly so there's probably a lot
more that I'll be able to add to the list. I can post it anywhere in
the UK (I live in Scarborough) but obviously this will cost a bit
extra (probably around 20-30 UKP), or personal collection is fine.

I also have a 4MB Atari STe for sale with Cubase, and:
External 120MB hard drive with TheLink
Multisync monitor (same type as Falcon one)
Lots of disks & boxed games, serious software etc.
mouse, joystick, other goodies.

I am selling this one on behalf of my brother who lives in York.

Any serious offers please let me know via email, and I'll try to
compile a complete list of things that I have to sell with them.
Thanks.

I may be tempted to split parts of it if the price is right... ;)
That doesn't include essential things like mice or device cables,
sorry!

So, does this mean you are not planning on upgrading or further
maintaining the Atari version of Magic? Maybe I'm just
misinterpreting. Anyway, what about the possibility of making a port
of the Magic GUI to Mint? As you say, Mint has its advantages over
Magic, and is very stable. Unfortunately, the GUI's on Mint aren't
nearly as nice as Magic's GUI. I would pay for Magic all over again to
have it be able to run on the Mint kernal! That would be the ultimate
update, as far as I'm concerned!

You're very right. In my posts I never question the validity of MagiC as a useful system. As a 68K based machine with limited RAM, MagiC is the only viable target OS, and a damn good one at that!.
As such applications developers should focus on supporting those old machines in mono mode at least. My point was that on more modern hardware and atari systems of the future, MagiC is going to become less and less useful. At some point depending on the application support will have to not be given. If I write an application, what features do I omit to make the application still useable on an older system. Do I do two different builds? Double the work? Or do I support my own hardware. The result of those questions is why applications like MyMail are great but are completely unuseable on slow systems. But it's a mail client. Shouldn't it be?

These are the discussions you end up getting into. Problem is that there isn't many developers that still run in ST high on an ST/e. Developers are addicts and graduate to fast clones or accelerated machines in a lot of cases. The result is that the mono machines running MagiC only might get less attention.

And what about cases like ARAnyM? Do you focus on supporting MagiC at all? What if it's a major pain. The only thing I wanted to address was my issues that on nearly every piece of atari hardware I own, MagiC unfortunately is a bit unstable for me. But yeah.. <3 your ataris well.. and hug MiNT and MagiC too. They're both great.

While this may be as constructive as your stop fighting about MagiC/MiNT discussion, this has all been tried before and is pointless. You either live with him or publicly bitch. He will NOT CHANGE. I'd venture to say he's incapable of it, but I don't buy that at all. He actually considers the bitching to be the best free advertising. Negative press isn't good advertising. He just doesn't get that. Of course what other dealer incessantly posts "Hey I'm broke, PLEASE buy stuff". Gee I wonder why nobody is buying stuff!? Doesn't take a rocket scientist to do a bit of market trend analysis and realize that people bitching about your methods is a bad thing. But anyway, I digress. Like I said, he won't change anything unless it involves typing 3 letters into the keyboard.

He also doesn't understand that the reason people bitch instead of killfiling him is because they know he could be a valuable resource to the community. Instead he's an annoying one. But then so am I ;)

I accept this as the culprit for some of my problems, but I have tried on
2 TT030's, 1 Falcon, MagiCPC demo, 3 Mega STe's and 2 1040STf's. In some
situations MagiC runs generally fine. In case of my primary Mega STe,
both TT's, and Falcon, MagiC will crash hard occaisionally. Even when
just working under Magxdesk. MagiC not using TOS is part of what makes it
so fast, especially in the disk IO department.

>

Yes, I tend to believe it's AES or disk IO related problems that I have.
I believe that's where the fault is introduced. I notice a large number
of crashes for me are on application startups. Even aniplayer has crashed
for me a couple times on some machines. Aniplayer is well written ;-)
In previous times I used to have major filesystem corruption problems.
Those problems are long gone these days for some reason or another.

> 3.
>

>

Ah but I thought MagiC had a form of memory protection that protects the
kernel at least. Yet nearly every time I have an applications crash it
ends up taking the entire system along with it. I run MiNT in unprotected
mode. Perhaps I was wrong on this point.

> 4.
>

>

The problem may also be that I tend to use the computer differently then
most people. MagiC seems to work quite well if you do things slowly, or
in serial order. I tend to open up 5 applications and move in and out
between them with stuff going on in the background. Even on a 4 meg STe.
It's just how I am ;-) I don't think I ever receive AES stack overflow
messages, mainly just "SYSTEM HALTED" in german. Or maybe it's gemsys
error. Can't remember for sure but I can start using MagiC for a bit
again to see. On my Falcon, when the system halted shows there always
seem to be a few bytes of screen memory displaying to the upper left hand
portion of the screen that get destroyed.

>

This was the impression that I was under, so I wasn't wrong on that. And
you can be as humble as you like, but you have competed with MiNT for a
long time. Even after MagiC development stops and may or may not be
considered for all intents and purposes abandoned, people are still very
animate about use and support of MagiC. It's a great system, with great
ideals. You are a fantastic programmer.

I've been meaning to look into MagiCMacX but for me, Macs are just too
expensive to justify. My girlfriend has a powerbook g4 I could try the
demo on if one exists ;-)

>

I couldn't pay you much but I could pay. I think a lot of people around
here would pay into a pool that pays you for your time. Set an hourly
rate and whomever would like to see you spend some time working on his
problem can pay money in and you'll work with him for that time. Sounds
like a good plan for me. I can also send you a TT030 I might end up not
using. But you should get a Falcon with CT60. They're REALLY neat.

As for the time, I think everyone is right there with you. I don't have
much time for Atari stuff anymore either :-/ Everyone has to focus on the
work that pays the bills, that's how life is.

> So, if problems occur now, the "non-MacOSX"-MagiC users must be either

> suitable bug fix can be derived, I then would be glad to create an
> update (MagiC 6.20++). But there is not much more I can do, e.g. I
> will not install and test magxnet.
>

My problem is that the problem is so intermittent and random I would never ever be able to reproduce it. As I said previously, for me it just seems like an "inherent problem in MagiC". Perhaps it's not and there's a specific app but I don't know. Sometimes I even have probs with MagiC crashing on bootup. Only turning the machine off for a bit seems to calm it down. Maybe memory stuff is not quite right. I'm going to very closely install a plain MagiC 6.10 installation and update it to MagiC 6.20 english according to DDP instructions and see what results. Maybe things will be better.

> If one cannot find the problem, he or she is free to use MiNT instead.
> It surely has advantages over MagiC, is free and open source, and
> (perhaps?) it is still being maintained.

Advantages for newer better systems, but surely a vast portion of current atari users are still using ST/e's. MagiC is the only good choice for them.

To close, I must compliment you on the amazing work you've done for the Atari world with MagiC. It seriously is an honor to write this to you. I may bitch up a storm but I only get upset about things I like/care about. In fact if I ever try to show off an Atari system to friends I will always use MagiC, because it looks better, feels faster, and has a fantastic AES. But think about the development fund thing. I think there's a lot of people here that would be willing to contribute a LOT of money to the ideals of writing an AES using MagiC's AES code for MiNT. I myself could justify at least $500USD, as long as the end product is free to distribute even if not open source. I know at very least I could do $100USD right away.

Thanks,
Mark

Tee hee, surely calamus could import and export Word format? But that's
not so much of a word processor as it is a DTP application is it?

Learn to read more carefully please. I didn't say that newspapers and
publishers use Macs because of QuarkXpress, I said that they used Macs
RUNNING QuarkXpress because PC's have NON-STANDARD font metrics and NO
TRUE LIGATURES in their typefaces, and because Macs work more reliably
with PostScript than do PCs.

Yeah, I realize it, but it's hard to know which of the crossposted
groups contain the troll to whom one is replying, so it makes it
difficult to arbitrarily cut groups from a crossposted list once a
thread starts that way. I 'm sorry if this causes any inconvenience, but
threads like this usually don't last that long, so just bear with it
till it peters out.

What about that much vaunted, but never seen (by me at least) product Atari Works? I have never tried it but might it work. And could bits of OpenOffice be persuaded to compile under MINT?. I guess that is just too big :-(

I might also add that for my recent course none of the above mentioned Atari software would suffice. Even though I have been studying to teach Mathematics we have had to produce dynamic maths work sheets that work in Excel. Now OpenOffice can (just about) do this but I don't think any of the other spread sheet products are compatible enough. The VB Script involved is really rather horrid...

We have also been passed documents in PDF format, which again can be fun to read on an Atari. I gave also needed to read the odd Power Point presentation, again a pain on the ST. Lastly non of the software used to drive the Interactive White Boards we used works on anything other than Windows. (even then it does not always work 100%),

This might sound very pessimistic, but when I am late with an essay (as I usually was) I did not want to be struggling with software that was

unsupported by the University, so I would stick to a PC, or at least have one for backup.

DB> Hi Doug ,
DB>
DB> I spoke to you breifly at the London Show about adding VIDI(12)
DB> support to Apex .have you had a chance to speak to Rombo about
this
DB> (availability of
DB> source code which they say to me they are happy to release to
anyone
DB> who want
DB> it) ? And probably more to the point is it feasible given its
DB> relatively low
DB> spec point ?

Nope, sorry - have not had the time yet, but I'll give them a ring
next week.
The only hassle I can forsee is that Vidi12 does not generate a
true-colour
image. This means a bit of additional image-conversion which although
easy,
does not comply with the way the program works just now. You will not
be able
to grab truecolour animations in realtime etc. but I imagine thats
pretty
obvious anyway.

DB> Anyway apart from that I am having lots of Fun messing about with
DB> Apex anyway ,

Great, glad you are having fun with it!

DB> plenty to keep me occupied until Expose is available ,what is
the
DB> current
DB> projected release date ATM for That ?

As far as I know (Expose is a Titan Designs project, BSS are only
involved with
the software side), the card should be available early next year. i.e.
February.

If you want a more accurate date, call Dave on 021 693 6669.

DB> Glad to hear that you are getting a lot of interest in it because
it
DB> is truly a
DB> fine program and deserves to do extremely well !

Thanks!

DB> Only One minor problem encountered so far though which might just
be
DB> down to other programs (outside).

Okay,

DB> If I have outside installed and I try to load JPG files onto a
DB> larger page
DB> (640*400)than screen sized (320*200) image Apex locks up ,this is
DB> with Outside
DB> set to compatible ,RAM into ROM protected, and all other switch's
DB> OFF , IS this
DB> due to VRAM not liking to deal with screen display , although
IIRC
DB> the same
DB> problem doesn't happen with GIF or TGA files .

Hmm, Outside does seem to have a few probs with the FileSelectors now
and
again, as well as other things.

To be honest though, if you only get problems with JPEG files then I
think I
know what the problem is - we use the Audio DMA to transfer the JPEG
data to &
from the DSP to give us a little more parallelism. This means the
program can
convert & process the pixels as they are
generated.

I think we have made the mistake of providing available 'virtual'
memory to the
JPEG routine for general use - the problem being that ALL
hardware, including BLITTER, AUDIO DMA, SCREEN DMA etc. cannot use
virtual

memory at all. The memory accessed by these chips does not go via the 68030 &
therefore bypass the MMU which is doing all the 'virtual' stuff. This is why
OUTSIDE allows you to leave some normal memory for the OS -it needs it for the
hardware!

DB> What it the best
DB> settings you
DB> have found for Outside ?

For good all-round results, set the pagesize to 16k. This prevents exaggerated
disk-thrashing (as with 8k) and is more efficiently managed than 32k. I think
copying ROM to RAM might (don't quote me on this one) be a little unsafe, as it
means the OS will start swapping in & out of RAM as the machine begins to use
up more space. It's a little scary that a program calls a routine in the OS and
it's on disk at the time! Generally, try to keep programs in ST memory by
setting their flags - but let them ALLOCATE from VIRTUAL memory. This should be
a much safer way to go.

Also, when you choose the amount of normal/alternative ram for use, always
leave about 2megs of normal space. This is absolutely mandatory for Apex to be
able to allocate screens. The value you enter as 'alternative' is simply the
size of the cache you wish to use on the virtual disk - the bigger it is, the
less disk-swapping you will have to put up with - but it is just a luxury & not
highly important.

If you get out of memory problems, try making the alternative 'cache' smaller.

DB> And any hints for setting up the CPX (I
DB> have found it
DB> necessary to limit the amount of VRAM to be used else you cannot
DB> load or save
DB> files)

That's weird - I'll need to try it.

I use these settings > LEAVE 32k (ST-RAM) : LEAVE 1024k (VRAM)

Hope this helps...

Regards,

Doug - dlittle@nest.demon.co.uk

>just to make yourself feel superior? The very fact that Wintroll post
>here yell me that it's YOU that has the problems!

Yep. You do seem to have an anger management problem. But it is
misdirected. Look at the message header. Notice the groups that this
thread has been crossposted to. Now for some more information.

The troll who started this thread, who, at least part of the time, calls
himself Lord Teviolus, has been making other attempts at starting flame
wars. His other recent attempts were aimed, for the most part, at several
8-bit newsgroups. Here is a sample:

"Why would anyone invest time in these stoneage systems like the ugly
C64 , the even uglier ATARI 800 and the most ugly "mutated
calculator", the Spectrum ?"

However, his attemps to troll started very few flames in the 8-bit
newsgroups. He seems to have found more fertile ground here though.

>You Wintrolls come here to this group to tell me that my choice of
>computer is a piece of shit and then expect civility from me? Think
>again, please!

Think yourself. You have done more to feed this troll than anyone else in
this thread that I have read thus far.

Best regards,

Sam Gillett aka Mars Probe @ Starship Intrepid 1-972-221-4088

You weren't aware of it because you weren't watching for it, because you
thought it couldn't happen. Such naivety leaves you open to attack.

If there can be one, there can be thousands. Most viruses are only
variants.

Edwin

>solution, how foolish of me.. Dennis forgive me such act.. o master..

For god sake man!!! Why on earth are you so touchy?
Whenever and whatever I write in here, there's one certainty... you'll feel targetted and come moaning about it. Shit... it is like walking on bloody eggshells all the time!
Whatever I post in whatever thread in this group, there's always someone who feels offended by it. I think it's about time that I start posting anonymously also, I get the impression that reading my name is enough to set you and some other people here in alarm fase 2...

>What i need to do, not to trigger bad reaction from u.. Shutup and
>vanish? I dont mind correction, i didnt know for magix/extension folder,
>but u had to revert it into bad thing again... thanx

I honestly don't know Janez !!!!!
All I did was to point out that the commands are already fully explained and that they happen to be in plain English just like the other MagiC docs. And now all of a sudden this is "triggering a bad reaction"...

I could have replied to several posts in this thread, I choose to reply to yours, because it actually was one of the few that made sense... but I should have known of course that this was a "bad" move.
Don't worry, you won't get any corrections from me no more, so you don't have to shutup at all and certainly not vanish from here. Unlike you I happen to appreciate your contributions, and unlike you I don't seek things in your posts that aren't there either.

Cheers from Belgium
Dennis

XBoot can also be configured to accommodate this via its batch function,
simply do a rename from something.prg to something.prx.

>Falcon, and it is the SINGLE MOST ANNOYING thing I have ever experienced
>;-)

Look no one is suggesting that you're dumb, but we're all humans and tend to
make mistakes from time to time. In my experience catching such a mistake by
yourself can take forever... while someone else could see it almost on the
spot. I'm not saying that your magx.inf file or the contents of your XTENSION
folder are no good, I'm just saying that there "might" be something wrong...

>Look, I'm quite sure it's nothing I've been doing wrong. I've been
>wrestling these problems for several versions of MagiC since I ever

>good. But it *does* not work for me and I will not just say it, I'll
>spray it because it pisses me off ;-) I feel like it was nothing but a
>massive waste of money for me. Sorry.

About a year ago I suggested to you that there might be something wrong with
your TT, and IIRC gave you the example of my first TT, which I eventually
trashed. Yesterday, Andreas Kromke suggested more or less the same thing...
I've once known a falcon owner who couldn't get a stable MagiC setup, I've
turned his machine inside out and finally had to give in. There was no way I
could install a stable MagiC on that Falcon, from time to time I read the same
thing here... so one can only conclude that Atari must have made a batch of
Falcons which have slightly different specs then the mainstream Falcons. If
you happen to own such a Falcon (or TT), then that's bad luck...

>The kind of applications I run under MagiC/MiNT include aFTP, CAB 2.8,
>Highwire, Aniplay 2.21, HD-Driver 8.11, and Magxnet.
>
>But you can't blame any one of these apps because I've tried alternatives
>for each.

Never say never Mark...
I happen to be looking into someones magx.inf file right at this moment, that guy just like you also uses Magxnet... and he has stability problems as well. I'm not blaming Magxnet, it's the way he setup his magx.inf file that sucks... Using his file instead of my own, causes my MagiC to behave strange also. You have no idea how many "weird" MagiC setups I've seen over the years. I don't laugh of turn these people into morons....
Sometimes apps that are being installed edit/change the file, other times one experiments a little adding or deleting things and forget to remove/put them back in later on.

>Actually from what I understand, MagiC 6.20 has a lot of MiNT
>functionality built in. This could be a load but it came from a rather
>reputable source.

Every MagiC has a lot of MiNT functionality build in. That's what I've always been shouting here, but no one wants to know. One only has to read the MagiC programmers docs to realise that the programmer sometimes went through great lenghts to make MagiC more or less compatible with yet again a new MINT command. If he wouldn't have done so, we would have two really incompatible systems now. It's just sad that making the OS more compatible always came from one side only, if the MiNT developers would have only implemented some of the Magic features instead of reinventing the wheel then the two OS's would be even more compatible...

>> You don't have to convince me!!
>> Tell it to Jo Even and Adam, they're not convinced at all...
>>
>MagiC is faster. What do we use atari for? The AES.. The windowing
>system. It's the most important part of the machine, and nothing beats
>MagiC's AES. Nothing.

Yep.... but like I said, you don't need to tell me.
I know it since 1987, that's when I bought my first KAOS TOS, and ever since I never looked back :-)

Cheers from Belgium
Dennis

Hi Derryck,

>So what's wrong with copying the fully-documented version of magx.inf over
>the cut-down one that you have a problem with?

Actually, there is a problem doing this for a number of users. People using magxdesk as desktop can't use this proposed method, because the file will be overwritten when they save their desktop. The magx.inf file has two purposes, it's a config file for MagiC but also for magxdesk.prg.

Please don't feel targetted, offended, made a fool or blamed for. I honestly didn't mean to .... :-/

Cheers from Belgium
Dennis

>>
>Well it really has that option, I've done it several times! What Papyrus
>does is giving the textfile the extension .doc. Word can open it without any
>problems. When you try to save it to your Windhoze computer, Word recognises
>the file as RTF.

Sorry Jos, but that's not the same thing.
Papyrus isn't even able to read its own exported RTF files properly...
e.g: load a file, no matter which one, but make sure it contains pics, for the sake of argument let's use bilder.pap (part of the demo docs) and export the file in RTF or if you like in *.doc. Now, load that document back into Papyrus and see what happens... and exactly the same thing will happen if you load it into MS Word or in whatever other word processor. Papyrus still can't after a zillion updates save/export RTF properly. And as you've just explained it surely can't save in MS Word format either... there's a lot of difference between RTF and MS WORD format...

Cheers from Belgium

No we do NOT have one virus for OSX. That site had a humor column featuring
an article which personally I find totally irresponsible.

Repeat after me...

There has never been a single virus for OSX!

Hi, Bob!

BW> One more question - how do I tell how much memory I have in a Stacy
BW> and STBook? I can bring up the desktop, but nothing seems to give me
BW> installed memory.

During bootup the installed memory is tested. When the test is finished,
the available amount is printed out. You have the chance to read it if you
don't press a key to abort the HD spin up delay...

If you have some tools installed on the HDs, there might be some variant
of a "control center" reachable from the "Desk" drop down menu. These also
give information about installed memory.

Regards,

Alexander

> will not install and test magxnet.

This is a good news. I can provide you a disk image of running MagiC if
you can provide some sort of special licence for ARAnyM developers to
let us debug problems.

best regards

STan

1) This particular bullet would have been more like a splinter in the
thumb. It would not have killed anybody.

2) This one virus turned out to be a hoax. IOW the number of viruses on
OS X is still zero.

> > > and it's funny how you apparently were not

IIRC, this is only the case on STe and TT machines. Not sure about the
STBook (even though I have one). Definitely not so on the STacy.
Assuming the STacy hasn't been upgraded, if it says 'Atari Stacy' on
it then it's a 1 MB machine. Otherwise it will be labeled 'Stacy 2' or
'Stacey 4'.

>If you have some tools installed on the HDs, there might be some variant

The Atari XControl accessoiry will do this, you need general.cpx I
think.

The cut-down one is only meant to be a starter, it's up to the user to add
from the full version once he or she is happy that it is basically working
FWIW. IAC Dennis has pointed out a potential problem with this approach.

> since i wasnt aware of the one in extension folder.. That was plain,

No it wasnt a bad move on contrary. But look from my perspective: u didnt
correct us, and prompt us to EXTENSION folder etc, but u also spiced with
your usual spice:

"...it would be nice knowing that someone somewhere actually reads
them instead of complaining about the lack of documentation..."

U also used some bold text earky in message... This is the part i dont like
and im touchy about... Replies and sugestion CAN be made more polite...
From your message we all looked like some complainers which refuse to read
docs and then hag bout lack ofthem.... Hard to ignore docs if u arent aware
of them....

Im preety sure, u would react the same, if u would have MiNT (or other,
not realy matter) guess and i would reply, that u need to read docs, before
u moan... (and u would prolly extend it to "you all") TBH, i do read docs a
lot, kinda need to do in Unix, but i realy wouldnt expect Magic docs in
EXTENSION folder... It is my fault, but u can prompt me normaly....

> Don't worry, you won't get any corrections from me no more, so you don't
> have to shutup at all and certainly not vanish from here. Unlike you I
> happen to appreciate your contributions, and unlike you I don't seek
> things in your posts that aren't there either.

Well as u wish.. I repeat that i dont mind to be corrected or guided, i
actualy apreciate help. And if u would just bite the tongue (fingers
actualy :) before adding "final touch" i bet we could get along much

better....

Unfortunately in MagiC AES and GEMDOS are not cleanly separated. E.g.
contrary to MiNT, the basic scheduler/task/thread modules (today one
could call it the nanokernel) are part of AES, not GEMDOS. So MagiC's
AES cannot be used as replacement for MiNT's one. The same with vice
versa. If I did total rewrite of MagiC today, I would do it much
better and use a layered design.

Mmmm!

It's getting very quick, isn't it! Someone must be super-optimising the HTML rendering part :) Mind you, I am using a CT2, but I've got a CT60 waiting to be fitted ;-)

I got the cache to work, so only a matter of time before things like full online graphics support methinks ;-) Highwire will come into its own when porno, erm Jpeg displayers are included!!

From a non-technical or 'user' point of view, it tends to get stuck permanently if trying to access a very busy site. I think that a 'timeout' or extra-powerful 'stop' button would be useful, but I'm sure that is in your list of things to do.

My personal favourite moment with Highwire so far, was when it first went online last Xmas. This was on the first anniversary of the project's current active period. I wonder where we'll be by the end of this year? :) If the intention is still to go for shareware, time to start saving up perhaps!

Keep going, this thing is getting better all the time!

> be forthcoming! ;-)

Guy,

I believe that in recent CVS versions of Aranym the clunky mouse issue may be fixed. However I wouldn't know as I have discovered an alternative method. For me, the clunky mouse issue only occurs when running aranym in a frame buffer. If i run it in an X window, it's fine. Well the X window sucks right? Press the scroll lock to switch back and forth between full screen. So the proper procedure is start aranym, press scroll lock. To switch back to x, press scroll lock again and then minimize. This works for me and I can run aranym for a very long time without the clunky mouse issues. Now I just have to figure out why the ethernet gives up on me after a few megs xferred.

> To those of you who wish to fight about MiNT vs MagiC, realize a few
> facts here, regardless of what you prefer:

If you read the entire thread, or all the threads that took that
turn you will see a trend. I understand your frustration, but I'd
prefer you were more specific as to who you are addressing.

If you followed the threads at all you'd know that:
1) They think it is somehow funny that I have a hades.
2) I mentioned open source and aIRC and suddenly I'm stealing code.
3) They propose a magic setup is faster at mp3 encoding than a mint setup.
4) Others have had comments made about their mother.

Which side went to these extremes? Certain magic users.
It is all to clear which side needs to grow up and I am not saying
all magic users here, you can tell by the posts which ones it is.

And it almost always starts the same way. If I just suggest for a moment
that there are a couple of free unix alternatives to say PhotoTip, well
I have just pissed off Dennis.

And to those that cannot run these free alternatives need to remember
they have chosen that path. I do not think the entire platform should be
frozen in time just because others refuse to upgrade. Just because you
can't run a specific program with a small memory foot print, doesn't
automatically make that application bad. Likewise, other apps are judged by
whether they are ported, regardless of whether they ever used that app or
not. If I had an original 520st and tried to run PhotoTip (binary is over
512kb) would that make PhotoTip a bad program? Heck no, it's simply aimed
at a different hardware arrangement.

Mac Virus II is open for business
(but not making a profit!)

Last updated 28th January 2001

1) Notice that they are not making a profit ... guess there are not
enough viruses to report.

2) Site last updated in January, 2001. I guess on the Mac we have
enough time to download our latest virus checking software.

Read a front page article in my local paper about the latest Windows
virus. I guess all publicity is good publicity.

No, I just knew of the URL off the top of my head. Yes, I did, but I
didn't read enough of the information on it. I said I was foolish to
mention that site. Why not read the entire thread before commenting
on something a half dozen others have addressed ?

> 1) Notice that they are not making a profit ... guess there are not

Keep guessing. There could be dozens of reasons.

> 2) Site last updated in January, 2001. I guess on the Mac we have
> enough time to download our latest virus checking software.

Again. I have been virus free for many years. That doesn't mean it
cannot happen. I would't be so smug. You have too much faith in your
operating system to think there are zero vulerabilities. Virex is
still selling Macintosh virus software. I have a feeling it is
looking for mostly pc viruses, but it would be interesting to know how
many it protects against targetting OSX. If any at all.

> Read a front page article in my local paper about the latest Windows

Sure, the online caching support opens up possibilities for adding new features. We'll have to wait and see what feature gets added next.

The scheduler is still in the works, but do keep this problem in mind when testing future releases. If it persists, you might perhaps consider mentioning to the HighWire forum, or submit a bugreport to the bugtracker. (find both at http://highwire.atari-users.net)

> project's current active period. I wonder where we'll be by the end of

No, it is for all machines >= 030, compiled with gcc because Pure C
can only produce 000..020. But because gcc provides a better inteface
for assembler parts this one is a bit faster than the other for Falcon
256 colours mode.

What part of "ZERO viruses for Mac OSX" do you not understand? Virex and Norton Antivirus do not check for OSX viruses because there are none.

They are not "mostly looking for PC viruses", they are *only* able to check for PC viruses because....There are no Mac OSX viruses.

There is no reason to purchase these programs unless you have a particular need to check files received from Windows that you plan on passing on to other Windows users and you care about passing on the virus.

This is an important point because there really has been no need to ever purchase Mac antivirus software (living solely in a Mac world). On the other hand, I can't imagine not having Norton Antivirus for Windows. This is worth calculating in terms of overall cost, and time/productivity considerations.

> I KNOW what the Macintosh can do and it's a wonderful machine. I
> don't think the average Macintosh users know what a windows machine is
> capable of aside from BSOD, worms, viruses, etc.

I know what a windows machine is capable of. I've been developing cross-platform for years as well as doing service and support. I've owned more PCs than Macs over the years (because I go through them faster), but I've always preferred using my Mac for any software app as well as for any task.

Wasn't the original post asking for what can you do with a Mac that you can't do with a PC? Well, you're not going to get any direct answer to that or vice versa. It's like asking what you can do with a new Mercedes that you can't do with a 72 Ford Pinto. Macs and PCs are both computers neither of which is capable of doing any task that the other can't...it's all about how you can do those tasks.

The Mac is easier, more elegant, more reliable, and just plain more enjoyable.

> I just don't buy it. I think it goes deeper than that. I think the

> disproportionate usage because people are stuck in old mindsets.

No, not the same software. There are PC apps that perform similar functions, but they aren't the same as iPhoto, iDVD, Final Cut Express, Final Cut Pro, iTunes, etc...

And the hardware isn't always the same either. FireWire on a Mac means *powered* FireWire. FireWire on a PC usually doesn't mean powered, but it might, you need to check the manual, though if you PC came with FireWire your manual might not actually state this, though if the store where you purchased it installed a 3rd party card, maybe they would know, but usually they'll just check to see if FireWire itself provides power and do a Google search on FireWire, coming across Apple's site and thinking all FireWire does provide power, so they'll tell you this only to find out that the device you bought won't work and aaaaaahhhhh!!!!! Just give me a computer that works like it's supposed to! Why wouldn't you provide power with FireWire if some devices would require it...oh, because PCs are *cheaper*.

A lot of people still perceive Macs to be better for doing things like creating DVDs because it is so damn easy to teach a monkey to do it without additional hardware or software on a Mac. People with "Google-Hz" PCs souped up to function (sometimes) as a $100 Xbox or Playstation see the DVDs and ask, "uh, how do I do that?"

The Mac person tells them that it's really easy, you just need a DVD burner with your computer. The PC person goes out and buys a DVD burner, then discovers they need a FireWire card...oh, one with power...then they discover they need video editing software. They purchase some piece of crap software package...Oh, how do I get video from my VHS? Mac user, "Geez, it's really not rocket science you know".

Then there's the whole dealing with the audio/video synch problems and the stuttering and then "how do I do the menus and stuff?" and "how do I put photos on a DVD?" Oh, of course they need even more software to do this...at some point they ask, "can't I just make a VCD?"

Ugh, it's just time and time again I run into people who evaluate a Mac versus PC purchase. They don't include the price of everything like anti-virus software or software *they can use*. They end up buying the PC to save $100 and then realize that while their PC came with a DVD burner just like the Mac, they can't use the DVD burner just like they could've with the Mac.

Thank you Andreas for your dignified and clear explanations.

I actually recommend MagiC to people with a plain 68000 (when they ask
about MiNT ;-)
.
MagiC's amazing speed remains unparallelled.
Without MagiC, multitasking on a 68000 would be practically impossible.

Ummmm... I seem to recall the "Doom" or "Snow Doom" virus that started
doing the rounds a few weeks ago, this one's a file deletion virus/trojan -
for the Mac - don't know a vast amount about it, but McAffee gives it a
mention.

cheers,

Lance

CSMA has kept the maccie forums relatively troll-free for a very long
time now. I don't think there's any danger of that happening. B)

Do you say "virus slash trojan"?

So. Is it a virus or a Trojan horse?

They are very different animals. There's a lot of confusion about
viruses, worms, and Trojan horses. I recently read an article in which
it said "worms, unlike viruses, make copirs of themselves..." I stopped
reading the article after that.

Virus/Trojans in your imagination don't really count...try again:

There are no viruses for OSX.

Feel free to try to link to any real news source saying otherwise.

5672. Re: Stop fighting about MiNT vs MagiC

Newsgroup: comp.sys.atari.st
Date: 2003-08-16 09:45:15 UTC
From: pep@hms.se

Source record: 24453

There are many MagiC-only apps available. People seem to have
forgotten that Atari choose MiNT to be the basis for MultiTOS..

Personally, I think it is bad coding to not support our two major
operating systems. They are not that different from eachother. (No
offence guys)

Both OS's have their pro:s and con:s, but thats not the issue. Some
people actually think it is a good idea to make programs that only
work with one of these OS:es, or that there must be something wrong
with the other OS when his/her program does not work on it.

In short:
All this reduces our small platform even further. Get along, folks.
Make compatible stuff - that way we can continue using our beloved
machines a bit longer.

Regards

I have one that's done 50 pages since new, only thing wrong with it is the wiper blade in the drumkit has failed. Its as new. would love to sell it to some one who would use it or collect it.
but in Aus only.

also have an slm804 with a dud wiper blade in the drumkit, they are repairable as aftermarket parts are available, but I have no use for it so I'll probably never fix it.

That is just completely untrue. There might not be any at the moment but only
if you live solely in an OSX world, but I can assure you there are plenty of
people still using MacOS on "legacy" machines that /do/ need some antivirus
software.

Hmm, interesting. I "clunk" all the time and was beginning to think it was a FreeBSD issue (I have occasional mouse jumping in Doom for instance). I've now also tried plain vanilla tos image and that's the same. Hopefully there's something in the code I can find, or something I can twiddle concerning my mouse.

> Now I just have to figure out why the ethernet gives up on me

> After this patch, is HighWire working correctly under fVDI?

Initial indications are "yes". Now that it recognises the cookie Highwire (I built an 030 version) launches under fVDI. This is a stock "afros" off the aranym site - that fVDI has no fonts installed. Unfortunately my "clunky" mouse renders it nigh on impossible to do anything else atm (like install fonts).

I don't see any mention of fVDI in the highwire source - was there a specific issue you had in mind?

5684. Atari Software/Hardware Sale

Newsgroup: comp.sys.atari.st
Date: 2003-08-16 20:51:21 UTC
From: daja300@aol.com
Message-ID: <20030816165121.22785.00000101@mb-m05.aol.com>
Source record: 24466

Hi everyone

I now have access to my Atari Software/Hardware stuff and will try to compile a list of everything I have for sale. I have mostly software. If you need something and know it by name, it would be best for you to tell me what you want.

As I said up top I will create a list but this might take weeks and maybe even months before it's completed.

I am still pulling stuff out my storage but have lots here with me as well. I am sorting things out.

Email me privately if you are interested. Again, I apologize in advance if I cannot find what you need up front, but I might still have an idea if I do have it and will try and locate it or let you know if it will be a wait.

Or simply wait for the list.

Thanks
Dave

>
> cheers,
>
> Lance
>

A Trojan is nothing more than a subroutine or subprogram in a program
that either deletes, corrupt, add dummy files (waste of time), or ceven
formats the HD and does things like automatically filling in the
specification of the prompts and clicking OK without you ever realize
this kind of stuff is happening. As the prompt window would never be
seen. These kind of codes (often destructive) would be a hidden task
inside an addictive game environment (best way to keep you from noticing
anything). Then funny part is this would be triggered either by
completing a level or some action in a game or triggered by the clock or
a timer running in the background. This stuff often does things that you
don't want and you never realize it is doing those things because you the
unsuspected victim would be merely too addicted to the game that you
don't care about anything going on. MacOS is not completely fool proof.
No OS ever is. MacOS is simply more stable. All a program has to do is
remap the keyboard and lock out certain keys and would have to "overide"
the OS which can be done especially through creative techniques.

The main reason this is not done is Microsoft is too big and hated and
this is one of the many methods of "protesting" by trying to destroy the
OS by making it so unreliable that people will use another OS. It is a
war between these "vandals" and "Microsoft". They will not stop until
Microsoft cease to exist or they cease to exist or give up. This is their
mentality described. Who says MacOS doesn't have security holes. All it
takes is someone exploiting the weak areas.

The overall point is NO operating system is invincible. Simply because it
is written by people that are not perfect. If the person (programmer(S))
is imperfect then there will be some sort of imperfection somewhere. It
always will be.

The only thing imaginary here is OSX safety.

>There are no viruses for OSX.

For how much longer?

>Feel free to try to link to any real news source saying otherwise.

Here is a quote from Macworld's web site.

"Computer viruses are, unfortunately, a fact of life these days. And
although we Mac users don't experience the onslaught of malware that folks
in the Windows camp have to fight off, we're not invulnerable, and we
mustn't become complacent. An antivirus program is a must. "

You do have browsers for OSX don't you? What happens if someone aims a
malevolent java applet at OSX users? I really doubt that _any_ modern
operating system is 100% bulletproof.

May I remind you that OSX is based on Unix? Unix viruses were running
rampant _before_ Windows became popular enough to become a target. A
bulletproof operating system? I don't think so!

For your own sake, hope that OSX never becomes popular. The most popular
operating system will _always_ be the prime target.

Best regards,

Sam Gillett aka Mars Probe @ Starship Intrepid 1-972-221-4088

> For how much longer?

Who knows? The point here is that there are no viruses for OSX and due to
OSX being less vulnerable, as well as being a minority OS, and not hated
like MS, there is significantly less risk.

Even more important is that with OSX (world), there is no need for virus
protection because there are no viruses. The day there is an OSX virus
there may be a need to purchase software...but maybe not as it may be
patched or as back in the days when there were Mac viruses, there may be
free programs like Disinfectant.

For Windows, it doesn't matter if there ever are more viruses because there
already are some that exist. This is why I can't imagine not purchasing
Norton Anti-Virus for my Windows boxes. I consider the cost of NAV when
budgeting for PCs. I do not consider the cost of anti-virus software when
budgeting for a Mac, since in almost 20 years of using Macs, I haven't had a
need to purchase anti-virus software for the Mac.

>
>> Feel free to try to link to any real news source saying otherwise.
>
> Here is a quote from Macworld's web site.

Which specifically doesn't say there has ever been an OSX virus.

>
> "Computer viruses are, unfortunately, a fact of life these days. And
> although we Mac users don't experience the onslaught of malware that folks
> in the Windows camp have to fight off, we're not invulnerable, and we
> mustn't become complacent. An antivirus program is a must. "

The article is wrong. Here's why... Norton et al, offer no protection against a future unknown virus. This is why staying constantly updated is important, right? So let's look at the mustness of NAV for OSX over the years:

2001 - worthless
2002 - worthless
2003 - worthless so far

Now suppose in 2004 we get a virus. If you already own NAV, you'll download an update and be protected. If you don't already own NAV, you can evaluate the risk, and if desired, you can purchase NAV at that time.

Even if there is a virus in the future, running NAV for 2001, 2002, and so far in 2003 has been a waste of time, money and resources.

Yes, a virus *could* come out for OSX, and it is a must to be aware of the potential risk, but it's not necessary to pay money, spend time, and consume resources to scan for something that simply isn't there.

As an OSX user, I will be much less bothered as OSX becomes more popular. Right now, I find it annoying as hell to get warning about Windows viruses, I hate having my Mac Weblogs still being hit by codered running on Windows machines, I hate receiving all the .scr, .pif, message.zip files from idiots still using Windows *and* not using NAV.

OSX is not bulletproof, but it is much better protected than Windows, and it is not solely due to the marketshare.

MS really needs to address the virus issue. I don't understand why they're so willing to take over every market and dictate how things will be done, but they won't take over the anti-virus market and dictate that all PCs connected to the Internet will auto-update patches...oh, wait, they can't event get their patches to be safe...never mind.

I should've specified *purchase* antivirus software for Classic MacOS and
have installed any antivirus software in OSX.

With Classic MacOS, Disinfectant which is free and other free patches and
repairs can be used.

5693. Re: MagiC Info

Newsgroup: comp.sys.atari.st
Date: 2003-08-17 00:34:36 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1061125702-100039AEicMi@gmx.net>
Source record: 24480

From: Janez Valant <swe@atari.org>
Date: Fri, 15 Aug 2003 11:28:45 +0200

Hi Janez,

>No it wasnt a bad move on contrary. But look from my perspective: u
>didnt correct us, and prompt us to EXTENSION folder etc, but u also
>spiced with your usual spice:
>
>"...it would be nice knowing that someone somewhere actually reads
>them instead of complaining about the lack of documentation..."

Look, someone had a problem, and the solution was handed on a plate. Then
all of a sudden the thread evolves in a "let's blame MagiC for it's poor
documentation". The MagiC docs are far from perfect, but I know a lot of
docs which are much worser...
1. The #_TSL variable is explained in the manual
2. it's explained in the "large" magx.inf file
3. it's explained in the MagiC Config HYP file

I can only conclude that the people complaining never read any of the
three, if they would have, then we wouldn't be discussing this...

>From your message we all looked like some complainers which refuse to
>read docs and then hag bout lack ofthem.... Hard to ignore docs if u
>arent aware of them....

I can understand you skip one doc, but all three? Also I only posted
after other people here pointed out that #_TSL was documented and where
it was located. Since nobody took notice, I posted the damn thing...

>Im preety sure, u would react the same, if u would have MiNT (or other,
>not realy matter) guess and i would reply, that u need to read docs,
>before u moan... (and u would prolly extend it to "you all") TBH, i do
>read docs a lot, kinda need to do in Unix, but i realy wouldnt expect
>Magic docs in EXTENSION folder... It is my fault, but u can prompt me
>normaly....

I'm pretty sure that I wouldn't react this way... I'm not mister know it
all, just like everyone here I come across a problem from time to time
as well. Untill today however I haven't encountered one that couldn't be
solved by reading the docs and in the event that the docs lack the
necessary information I apply some logical thinking, and sometimes just
plain luck or coincidence solved the problems also... I do get pissed
off however when people refer me to reading docs, and the relevant info
isn't there.
BTW: I goofed... the magx.inf file isn't located in the XTENSION folder,

but in the UTILS folder, If you never looked inside that folder, now is the time.... there's some more helpfull stuff in that folder.

>Well as u wish.. I repeat that i dont mind to be corrected or guided, i
>actualy apreciate help. And if u would just bite the tongue (fingers
>actualy :) before adding "final touch" i bet we could get along much
>better....

I wasn't aware that we don't get along very well... I'm convinced if we would ever meet each other, we would jump into the first pub on our way, and discuss Atari related stuff until the landlord throws us out, and we would say bye bye as the very best friends. As for biting in parts of my body before adding the final touch.... sorry, can't do that. We've all got our own style, after all these years people know that I'm upfront, I like to call a horse a horse... changing my style, would make it fake.

Cheers from Belgium
Dennis

Hi Steve,

>> 1) They think it is somehow funny that I have a hades.
>
>No one has mentioned any humour with regard to your Hades, I'd like one
>myself except they seem to turn you into a reclusive a-hole.

It's not the Hades by it self that turns someone into a reclusive a-hole,
it's the OS which runs on it that is responsible for the brainwashing and
the blurred vision. A clove of garlic on the monitor is rumoured to help,
ported unix stuff can't stand the smell.

>>4) Others have had comments made about their mother.
>
>No they didn't you moron, go back and read the post concerned.

That could be a bit of a problem... he has replaced Pine for Entourage,
that's even bigger crap.
It's sad really, here's an oh so dedicated Atarian, and to follow what's
going on here, he has to use a Mac and software from enemy number one...

>>And it almost always starts the same way. If I just suggest for a
>>moment that there are a couple of free unix alternatives to say
>>PhotoTip, well I have just pissed off Dennis.

Spewing your usual bullshit again I see?
PRODUCE the relevant posts or crawl back under your rock...

>It is all to clear which side needs to grow up and I am not saying
>all magic users here, you can tell by the posts which ones it is.

Changed your mind all of a sudden?
"So play with your kiddy OS as the rest of us adults move on. ;-)"

Does that quote ring a bell? If not, I *can* produce the post.

>And it almost always starts the same way. If I just suggest for a moment
>that there are a couple of free unix alternatives to say PhotoTip, well
>I have just pissed off Dennis.

You'll need stronger ammo to piss me off...
Oh and about PhotoTip, I put it to you that there isn't one free ported
unix alternative that comes even close. Take a good look at the PhotoTip
features, it's much more then just another digital camera driver...
You don't have to suggest unix alternatives to me, I'm a Atari user, unix
stands as far from me as Amiga alternatives. I don't settle for second best
either, supposing that I would be even remotely interested in running your
suggestions, I certainly wouldn't do it on this platform. A Mac or PC are
far more suited for running these... It's gonna take more then pine, wget,
samba etc to convert me.

>Likewise, other apps are judged by whether they are ported, regardless of
>whether they ever used that app or not.

To be able to use the apps, one must use MiNT. The fact that these apps are
tied to one OS are enough to judge them. And the very few that do run on
the other two OS's are hampered by a non available GUI, lousy docs and a
lack of features... if fifteen years ago someone would have released such
crap he would have been nailed against a wall, but now all of a sudden
we're expected to cheer...

Cheers from Belgium
Dennis

If you have, then I digress :)

However, Janez is right...this guy really could be an asset to the Atari community...

You know I'm tempted to start my own Atari mail order business in the US...just to show Ben how it's done.

Then again, he was probably one of the kids who never learned that square pegs don't fit in round holes, so I guess it would be a lot like winning an award at the Special Olympics, huh?

Oh well.

Peace, Atarians!

Julian

I am sure the file is the right one.
It looks like cntscrn3.prg doesn't find the file.

Did you put the file in c:\ ?

Does CNTSCRN3.PRG display an error message at boot ?

Did you try to click the "load" icon (hard disk with blue arrow)
in VIDEOMOD ?

Did you try to make custom resolutions with centvid3.app to
verify that your centscreen setup is working ok ?

What software versions do you use ?

I use centscreen v3.3.1, centvidel v3.1.9 and videomod v1.2.0

Thats your view.. I assure u, i wouldnt... U bashed me and some ppl i find very usefull to scene too much, that i would go and drink with u... Person can be blunt to me, can set things on right place, correct me.. but not bash and call names.. All only on basis that i use other OS. So far u didnt agree with ONE argument i told so tell me what we could talk in pub then... I dont know how things are in Belgium, in Slovenia we are a lot more polite. Being blunt can be done diferently as u do....

> body before adding the final touch.... sorry, can't do that. We've all
> got our own style, after all these years people know that I'm upfront, I
> like to call a horse a horse... changing my style, would make it fake.

No u dont call horse a horse... If u think u are honest and non biased, then u live in mistake... In message to Peter, u again generalise all to

MiNT corner and "spewing bulshits".. Same u do when bashing developers, u dont distinguish betwen MiNT OS developers, who work hard on MiNT, to preserve all Atari flavours, or AES developers do the same or APP developers who also do exactly the same.. For u ALL developers associated to MiNT are just lame, braindead porters.. Developing MiNT kernel or AES is not porting, its true developing. MiNT kernel is not just ported like Linux one, its done from scratch, with bios/xbios etc, genuine Atari development.

Name me one reason why MiNT dont use linux kerenel, if its so alienated as u wana ppl to believe? Or why MiNT braindead porters develop Airc, Amail etc when we can use alienated pine etc? Or why there is NAES, or why XAAES is developed (not ported) it MiNT dev team goal was to alienate the platform?

But in MiNT corner, "spewing alien bulshit" is Lonny, with his Airc which is true atari app, using va_start, drag n drop etc protocols, stik stack, AES developers, hard to imagine they alienate or port stuff, Frederic who also did some usefull tools, geniune Atari apps, altough mainly oriented to setup MiNT or shells for shell commands, MiNT kernel guys, which does great job with kernel, which is NOT porting like some Linux kernel, but unique Atari only code, and many other, inlcuding me. And, please, dont give me "its no use to me" argument, since that dont make those apps any less Atari apps....

So u call only your own horse a horse, others horses, maybe just diferent colors u call donkey, and their owners even harder words...

I can understand that u dislike ports, i dont like them too much as as well They are necessary evil to get some tasks done... But why u must generalizing that tho whole scene, calling developers names, and so on? I didnt hear that anyone would force u or anyone else from magic to MiNT or anything else. U still go berserk when see MiNT written in a message that dont call ppl names and declare MiNT a shit.. And on other side, u saw message which u intepreted as threat to magic (this thread) and u went up....

Quit pointing fingers at groups of people, i.e."The MiNT Developers". If you have a complaint with one particular developer, then I suggest you address it to them, not bash the MiNT developers as a whole. This is the exact kind of shitty attitude that alienates people, not applications that won't run on YOUR system. You don't see me bitching because I can't run the latest version of Calamus on my Mega/STE. We need new software for the Atari platform. Period. Even if it only runs on 5 people's machines, it still keeps people interested. It's something to talk about...in other words A CONSTRUCTIVE CONTRIBUTION TO THE ATARI COMMUNITY...hint hint.

Now, here's my suggestion if you actually want to HELP the situation:

Start a list of the apps you notice don't run on your system. Build a website around it. Email the developers about the problem, and get other users who are interested in those programs with similar setups to back you in your statement...have them email the developers too. These kind of actions will bring about change. Not publicly bitching that your apps won't run, then bashing those who write software as a labor of love.

Okay....I'm done. Anyone else wanna step up to the plate? ;-)

Peace, Atarians!

Julian

> Okay....I'm done. Anyone else wanna step up to the plate? ;-)

Sure, I'll bite. As I've said before in another thread, it doesn't
matter where software comes from, what type of interface it has, what
OS(es) it runs on. As long as *someone* finds it useful and enjoys
using it, even if it's one person, it's valuable to this platform. If
you don't like it, don't use it, and definitely don't bash it. I
personally don't like CLI's and text-based apps as much as GUI-based.
But that doesn't mean I should call them all crap, or say they
shouldn't exist on the platform because something with a GUI or
other/more/better features exists. Just like in life, diversity can
make for a much more healthy and interesting situation on our
platform, and we should welcome it!

Also, as far as "Mint-only" software not running on Magic, that's not
entirely true. Someone else suggested, and I've tested successfully,
that most Mint-ported Unix apps *will* run on Magic. The only problem
is that *some* require something other than vt52 emulation, and a U:
drive capable of long filenames in its root directory (which I've yet
to get Magic to do). Some also require a termcap definition, which I
haven't figured out how to do (someone please tell me if they know).
Otherwise, as long as it doesn't absolutely require these, it'll run
just happily on Magic.

As a side note, we *really* need a more versatile terminal program
that is able to run on Magic other than vt52, one that can handle
vt100, 102, 200, etc. If Magic stuck to the Atari-defined AES
standards, it wouldn't be a problem (I'd love full AES 4.1
implementation). We would then be able to use TOSWIN.

Basically, I've used both Mint and Magic, and I like both for certain
reasons. I would personally *love* to see them combined into one
glorious, full featured OS! Both are lacking in areas that the other
excels in. I'd love to see Magic's GUI ported to Mint, upgraded to
full AES 4.1 compatibility, running on a complete Mint setup.

At any rate, I agree. This bickering is stupid. I can't stand watching
elitist attitudes causing arguments that 1. aren't productive, and 2.
can only do harm to the platform. So why do it? Both OSes are valid
and well-written. They both have their good and bad points. And you
use the one with the fewest bad points that would affect you and let
the other one be just as useful for someone else.

Just my 2 cents... again.

It's supposedly still in development. See http://nb.atari.org/ for
details. Unfortunately they haven't released a new preview since 1997.
I really wish they would, though! Their description of where the
project is now seems *so* vastly improved over the preview. They've
probably put it on the back burner, or at least half-way there, in
order to work on ACE. Still, even with just a one-level preview, it's
the most impressive run-n-jump style game I've seen on our platform. I
hope they finish the thing soon, or release another preview!

MiNT isn't going to go away, they should just except that this option is as valid as magic, if not more. Rather than sink my money in magic to get a lowend system useable, and still have memory limits, I took the path of sinking that money into better hardware. I can run PhotoTip and the unix alternatives, and regardless of what Dennis thinks, the main issue is getting the dam images off the camera. I can post process them with any number of graphics apps later. It's just like in 'The Matrix', the problem is "choice". Why they can't let the other side live in peace is beyond me. Dennis would rather run mint and anything related to into the ground. It is a piss poor attitude for sure.

Hi Uwe,
I have a different problem when trying to boot a Megafile30 from a
floppy (tried AHDI, ICD, and HDDriver). HDDriver (8.04) loads but it's APP
says the Megafile is not supported (not SCSI).

Mike Freeman & Julian Wolfe, well said. Discussions and disagreements are good, but arguments of this nature are worthless. They show a lack of perspective, meaning they show no awareness of anothers perspective. I once saw a piece of wisdom on a bar room wall that I think applies. (aimed at no one and everyone!)
"It makes no sence to argue with a fool, because onlookers can't tell which is which!"

Don't do that, just do whatever it takes to filter them out.
My last scan of usenet trashed 22 posts. It works.

Can you be more specific with the error message? Something like
"Megafile is not supported (not SCSI)" is nothing reported by HDDRUTIL,
at least I cannot remember any similar message.
Note that the Megafile is ACSI, not SCSI.
The very first thing to do is running the ID check. If the drive is not
found then there is a hardware problem (cables, drive) and it makes no
sense to run anything else as long as this has not been fixed.

I don't have any problem sleeping at night; my kill filter does a very fine
job of screening the person who jumped down my neck when I offered a Falcon
for sale here some weeks ago, plus the Ben ads and other sundry idiots.

I would suggest however that the DDP Translations sig not be used for
postings in this and the MagiC/MiNT thread so as to avoid confusion with
personal opinions.

> Don't do that, just do whatever it takes to filter them out.

None of our stuff is of any interest to you anyway Lonnie.

Hi Julian,

>You don't see me bitching because I can't run the latest version of
>Calamus on my Mega/STE. We need new software for the Atari platform.
>Period. Even if it only runs on 5 people's machines, it still keeps
>people interested. It's something to talk about...in other words A
>CONSTRUCTIVE CONTRIBUTION TO THE ATARI COMMUNITY...hint hint.

Should I tell you where you can put your "hint hint"? :-)
If you've followed this and some related threads the last six weeks then
it should be obvious to you that this is not a MiNT versus MagiC issue,
although some people like to think it is.
And 5 people's machines hasn't got anything to do at all with the Atari
community, five people is a tiny club... not a community. That proposed
app running on 5 machines, well *that* would alienate people from this
platform.
And that ported stuff isn't exactly "new" either....

>Now, here's my suggestion if you actually want to HELP the situation:
>
>Start a list of the apps you notice don't run on your system. Build a
>website around it. Email the developers about the problem, and get other
>users who are interested in those programs with similar setups to back
>you in your statement...have them email the developers too. These kind
>of actions will bring about change. Not publicly bitching that your apps
>won't run, then bashing those who write software as a labor of love.

I suppose that you are the funniest one at home when the cat is out? Did
you get the impression that I was even remotely tempted to run that crap?
I couldn't give shit if that crap runs well or blows up the computer, it
has absolutely nothing to do with Atari, and I won't spend one second of
my time on it... And whenever someone comes cheering about it, I'll come
bitching... if only to keep the balance in... :-)
Call it what ever you like, people porting software IMO aren't developers,
they don't create anything, they just add more crap to the ever growing
pile of shit... one day that pile will collapse, and the remains won't be
a pretty sight, one doesn't need a crystal ball for this, it's plain and
obvious to see.

Cheers from Belgium
Dennis

Date: Sun, 17 Aug 2003 17:15:15 +0200

>In message to Peter, u again generalise all to MiNT corner and "spewing
>bulshits".. Same u do when bashing developers, u dont distinguish betwen
>MiNT OS developers, who work hard on MiNT, to preserve all Atari
>flavours, or AES developers do the same or APP developers who also do
>exactly the same.. For u ALL developers associated to MiNT are just lame,
>braindead porters.. Developing MiNT kernel or AES is not porting, its
>true developing. MiNT kernel is not just ported like Linux one, its done
>from scratch, with bios/xbios etc, genuine Atari development.

There's your usual blablabla again....
First of all I replied to a post which advocates apps that run on the
three major used OS's on this platform. So don't coming singing the song
about MiNT or AES developers, they have nothing do to with this and aren't
targetted either.

>And if u realy meant message for all, why u start it with "Hi Janez"?

That's merely being polite... I've responded to your post, so I address
you, if it's personal then I'll mail you.

>Name me one reason why MiNT dont use linux kerenel, if its so alienated
>as u wana ppl to believe?

Because (luckily) our hardware lacks the necessary power ?

>Or why MiNT braindead porters develop Airc, Amail etc when we can use
>alienated pine etc?

Because even the greatest MiNT die hard realised that Pine is ported crap,
and nothing beats a platform specific app?

>Or why there is NAES,

Because the developers recognised a market for it...

> or why XAAES is
>developed (not ported) it MiNT dev team goal was to alienate the platform?

They're all having wet dreams about implementing X shit, but (luckily) the
hardware lacks the necessary power... :-)

>Or why MiNT braindead porters develop Airc, Amail etc when we can use
>alienated pine etc? Or why there is NAES, or why XAAES is developed (not
>ported) it MiNT dev team goal was to alienate the platform?

>But in MiNT corner, "spewing alien bulshit" is Lonny, with his Airc which
>is true atari app, using va_start, drag n drop etc protocols, stik stack,
>AES developers, hard to imagine they alienate or port stuff, Frederic who
>also did some usefull tools, geniune Atari apps, altough mainly oriented
>to setup MiNT or shells for shell commands

You know very well that I don't have anything against these apps, but if it suits you, you'll use it as an argument against me, time and time again. The "alien bullshit" is the ported stuff, who's recently been cheered
here as the next best thing to come. That crap stands as far from my bed as a PC program. And since almost everything is one OS-specfic all it does is split the platform even more, you can argue until you drop dead, it's useless.... I'll never change my mind or views on this.

>So u call only your own horse a horse, others horses, maybe just diferent
>colors u call donkey, and their owners even harder words...

Thanks for the free analysing however these are your views...

>I can understand that u dislike ports, i dont like them too much as as
>well They are necessary evil to get some tasks done... But why u must
>generalizing that tho whole scene, calling developers names, and so on? I
>didnt hear that anyone would force u or anyone else from magic to MiNT or
>anything else.

You interprete it that way, if Lonny for example tells me to stay and play further with my kiddie OS, I know very well he's not generalizing, but you on the other hand would automatically come to the conclusion that he means that *all* MagiC users are kids playing with a kid OS.... that's the main difference between us, so start reading what really is written, instead of looking for things between the lines...

>U still go berserk when see MiNT written in a message that dont call ppl
>names and declare MiNT a shit.. And on other side, u saw message which u
>intepreted as threat to magic (this thread) and u went up....

See Janez, that's an example of what I just wrote.... you read things into my posts that I've never written : I never declared MiNT shit, but I did and do declare almost all the MiNT-specific things crap, shit, lousy etc... almost all the Mint-specific stuff is ported and it shows, MiNT isn't responsible for this, it's just an OS. And it's a pity really, it deserves much better.

>> I wasn't aware that we don't get along very well... I'm convinced if we
>> would ever meet each other, we would jump into the first pub on our way,
>> and discuss Atari related stuff until the landlord throws us out, and we
>> would say bye bye as the very best friends.
>
>Thats your view.. I assure u, i wouldnt... U bashed me and some ppl i find
>very usefull to scene too much, that i would go and drink with u... Person
>can be blunt to me, can set things on right place, correct me.. but not
>bash and call names..

Where did I mention "drinking"? :-/
But OK... if we ever would meet, let's have a wrestling match, I will wear a T-shirt with MagiC logo and you can wear your favourite Open Source for all logo T-shirt. Although beating an "old man" up isn't very fair....
And BTW: I'm pretty sure that I've *NEVER* bashed you personally, once again you're generalising the issue. Have you any idea how many times I've been bashed and people I find usefull when I would apply the same standards as you? So it's OK to write that all MagiC users are morons but not vice versa?

>I dont know how things are in Belgium, in Slovenia we are a lot more
>polite. Being blunt can be done diferently as u do....

Let's not bring politics into this....

>U still go berserk when see MiNT written in a message that dont call ppl
>names and declare MiNT a shit.. And on other side, u saw message which u
>intepreted as threat to magic (this thread) and u went up....

MagiC isn't in danger at all, there's absolutely no need to come forward and defend it, an OS is as good as the applications running on it... The way things are going, we're not going forewards at all, the gap between our platform and others gets wider weekly, not because of the OS, but because the lack of apps, and since it's quite clear now after all these weeks of discussing, that we shouldn't expect a lot coming from the MiNT corner in that respect, MagiC is very safe....

Cheers from Belgium

Hi Uwe,
I didn't want to get into my problem in someone elses post (although
it sounded like that). The point I was trying to make was that I didn't
think HDDriver would be useful on a Megafile. Please correct me if I'm
wrong.

More specifically:

After HDDRIVER.PRG is run the message appears: no partitions found.
In HDDRUTIL.APP, Tools, Configure Devices shows "Atari..SH/Megafile"
highlighted and clicking on OK gets the following message:
STOP (w/eye catching red sign :) This device is not compatible with
the SCSI or the ATAPI specification.
I don't see an separate ID Check program but Device Check shows:
Bus 0:Atari ACSI
00:00 Atari SH/Megafile Direct Access

I bet I will :-). HDDRIVER actually supports any kind of drive that can
be connected to an Atari, including any Megafile drive.

> More specifically:
>

I see. This indicates that there was a communication error with the
drive. A hardware problem is extremely likely. The error messages
referring to Megafile drives are often quite unspecified since these
drives do not return as much (and as precise) error information as SCSI
drives. But still much more than IDE drives :-).

Iwe seem new levels, Waterlands and Snowlands, and new characters (Wilhelm ans Wilhelma), etc and all i can say its that it realy is worth all the waiting... Thomas is superb, he does all the code, gfx and music by himself, so things dont move so fast, esp since he also did ACE and FlexTrax meantime, and both are verz good apps.. He does say he will finish it, just uncertain when.. But waiting will be rewarded :))

One way to fix a wiper blade is simpler than making a new one into the right shape. SLM 804 wiper blades cannot be had in the USA.

With a very sharp blade to help, peel the wiper part off any new wiper blade assembly. Tear the wiper part off the SLM part, and clean up the slight mess on the metal left behind. Then, using a glue sold in the USA as Goop, or Shoe Goo, glue the new rubber to the old metal. It needs to be pressed into place, and is more slippery than your best analogy, so a few small nails into an old board to make a weighting fixture might help.

Leaving the completed assembly in an oven set to the lowest possible temperature for about a half an hour also helps in the difficult project of sticking rubber to metal.

Works for me. Also have a 605, and intend to use that in a business application, and want spares.

Also, would like contact information for SLM 805 parts from Australia, if you have it.

Jim

IMO no, I think he is right. You need to consider what is of use to
others than yourself. And everyone should keep in mind, that an opinion
is nothing more than opinion, not an absolute truth.

An open mind can often be rather handy.

Pine a ported crap?
What emailer on atari (not ported) supports IMAP? (yes I use that)
Please do some research before you claim something to be crap.
PINE is awesome because of IMAP, speed, low reqs (specially good on low
end Atari), you can print, spellcheck, addressbook, check newsgroup mixed
with email, easy interface, constantly developed/updated, multiplatform
mailer, you can use any editor you want to type your messages, (wanna use
Luna to type your email? no problem, set pine to use external editor),
wanna view Attachement pictures (MIME) from PINE? define a viewer to start
a GEM viewer etc.
Very powerful mailer, this is not crap, and has been available since AGES!
Didn't have to wait for ash to release their mailer, half-assed.

Besides, because it is text based (ncurses), i can check my email,
newsgroups from anywhere (from work for example) as long as I can telnet,
or ssh to my machine, like if I was at home.
How do you do that on magic?
You probably don't care anyway.

Oh, and btw, if pine was such crap, why does it even exist on windows?
Or even macosx!!!
Don't they have good mailer as well?
The entire must be mad.

> deserves much better.

One thing you seem to forget is:

Mint environment = all main GEM application + magic apps (most of them
anyway).
So in what way is that bad?
Oh and let's not forget that ON TOP of that you can run a shit load of
unix apps, at the same time as your GUI! with no need to switch anything.
It all cooperate very nicely.
Do you know how cool it is to have papyrus, or calamus or whatever Atari
GEM application running and in another window having some unix

application?

MiNT = what you've got + extra.
(perfect combination if you ask me)

Some people are getting pissed because:
Magic = what you use to have - some extra that don't work anymore.
(otherwise GEMDOS FATAL ERROR)

Well you totally miss-interpreted, I was only suggesting the guy
filter whom ever it is that he finds offensive. Geesh you guys
are touchy. I did not list anyone specific I said "them" and you
read to much into it.

Noone is moderating this group, hence anyone can make their own rules.
Some like to notoriously post advertisements, some like to insult
people.

But then, there are also people who likes Atari computers and
compatibles.

Source record: 24375

I have been trying to get ppp dial-up working again under Mint
and I am struggling.

Connexion can now find ppp but I can only get this in the console
window and the modem does not attempt to dial.

Aug 18 22:17:14 milan pppd[103]: pppd 2.3.11 started by root, uid 0
Aug 18 22:17:16 milan chat[104]: timeout set to 60 seconds
Aug 18 22:17:16 milan chat[104]: abort on (NO DIALTONE)
Aug 18 22:17:16 milan chat[104]: expect (^M)

The file /etc/ppp/option has one line containing

ttyS3

The file /etc/ppp/options.ttyS3 has the dial-up connection info
but I don't think it is getting that far at the moment.

I know that the port is ttyS3 because my Handspring will sync
using JPilot on ttyS3

Do I need a file /etc/sysconfig/ppp.config ?
What should I put in it for dial-up ?

All help gratefully received.

Regards,

Peter

I have since moved my operations to a TT, and so have decided to part with my much loved falcon. It has everything required for a top music setup.

14mb atari falcon with 6 gig internal hard drive (mouse and svga adapter inculded)
1 gig external scsi hard drive (required for audio recording in cubase audio)
Cubase audio 2 & steingerg spdif interface
Soundpool FA8 analog output device
Steinberg SMP24 (2 in 4 out midi interface with smpte)

I have an idea at the srt of money I'd want for this lot, and I'd prefer to sell it as a whole, but for now I'm happy to take offers (ater all, I can only say no).

I also have a near complete notator logic setup (software, log3 and unitor 2)

I'm in the Uk, but happy to ship anywhere, though I imagine cost may be an issue, but am happy to do it.

well according to some posts and specs by Derryck Croker you are sat on a
goldmine,
it must be worth a swap for a 3 bedroomed semi in Cheshire, a fleet of Jet
Skis, or single engine light aircraft or fully equipped narrowboat.

This is a utterly wrong statement. Just cause the GUI is not what you
expect it to be doesn't lessen the feature set. On any platform pine
out performs anything I've ever seen, especially on the Atari.
Nothing comes to close to all these features. You really need to separate
MiNT from pine, the 2 are not related since pine exists for nearly all
platforms. I can see your comments come full circle, this is where the
piss poor attitude began, back with CLI's and pine and so on.
I don't even use pine and still nothing on this platform comes close to it.
Nothing probably ever will.

>> deserves much better.

This is your fatal mistake, and the main reason I consider your posts worthless. Yes, I happen to see this one, only cause someone quoted it. Not only do you insult the dedicated Atari users who take the time to make this software available. You are insulting the users that use pine on any platform. You also insult the authors of pine itself. These apps are 100% optional under a mint setup, I don't see why they are viewed with such hatred. I personally used pine on my TT030 and Hades for quite sometime and hense I take those comments as offensive as others do.

Not only is that ignorance on your part, you fail to grasp that pine looks nearly identical to all other versions on other platforms. It's suppose to look like that. Duh! Some people prefer this stuff, and yes it's not for everyone, but it most definitely has great value to many, and not just on the Atari platform.

I could easily say all magic apps that refuse to run on my mint setup are complete junk, trash, whatever. But in reality that is only my opinion and they will still have value to someone else. Someone such as yourself maybe. Apparently you have no feelings whatsoever for the other guy who finds the stuff you can't use very useful. Sad.

> Some people are getting pissed because:
> Magic = what you use to have - some extra that don't work anymore.
> (otherwise GEMDOS FATAL ERROR)

Well, the hatred comes from somewhere, it might be related to the fact that they can't run the stuff easily if at all. But the culprit is magic, as it is the one that fails to follow the standards, followed by iconnect. Yes let's reinvent the wheel and make it non-networkable and incompatible with mintnet, which was out long before it.

Hi Rustynutt,
I agree with you whole heartedly!!!! People
sometimes expect other people to give up there
machines for a little bit of nothing. If you really
wanted to buy my Falcon I would not let it go for
anything less than 750 to 1000 dollars. Think it is
highway robbery??? Read the signature at the end then
say that agian. I also have a 120GB hard drive I have
to get added onto the IDE chain of the Falcon yet!!!!
For storing movies and music over my networked falcon
and Apple computers!!!! Basically for backup of those
files. What would one offer this kinda setup???

Thanks,

This is a $500-$600 machine and it's that simple. If someone won't pay, don't part. I saw a bone stock Falcon go on eBay for $350 a few days ago. People think they're going to get the quite expensive FA8 and SPDIF for free? I WANT those two items SOOO BADLY. But I know I'm going to have to pay an arm and a leg for them :-/

That glue sounds like what's called Evostik in the UK; it's a contact
adhesive that smells very powerfully! It produces a strong bond.

I very strongly resent this by the way. Missing smiley or not, the amount of work put into the translations available for /free/ download by the three members of DDP Translations would stagger you.

I'm not addressing this to you in person Lonnie, but in general, as I'm fed up with posters apparently coming out of the woodwork to deliver some jibe or other and then nip back again.

I'm strongly reconsidering how much effort I'm prepared to put in supporting the Atari community.

> But from what I see it's just one of them, and the others don't have the
> nerve to tell him to shut up.

Everyone is entitled to their own opinion, and Dennis (and Peter too) are entitled to theirs. Again, all I'm suggesting/asking is that Dennis just change his sig for posts which reflect an individual opinion. I'm leaving my sig just as it is for this one post as a reminder.

I guess we're all guilty of misunderstanding from time to time Lonnie, but a little selective pruning of the message that you were quoting might have put your point over more clearly maybe?

But at least that gives me the opportunity to say that I was guilty of
saying "arse" once. Dennis has never used bad language, and I know that
Peter hasn't either (well, not in English anyway ;-)) So the suggestion
that DDP Translations are at all guilty of corrupting children with the use
of bad language as suggested by someone or other does seem to be actually
slander!

You're point being? You can hardly accuse Derryck just because you
don't want to pay the price he demands. Even if the price is steep, he
is free to do whatever he wants. You're free not to buy it.

You're also not forced to write bitter and silly remarks about this
issue from now on until the end of time. Let it go, will you?

Hi,

is it possible, that one of your configuration files does not have unix line ends? You can see this, if you load them with vi, at the end of every line is a ^M, this means it does not have unix line ends. you can change the files with a tool called crlf or cr2lf AFAIR.

Bye

It looks like our anonymous poster lives up to his name and is a total
and utter "Hunt". Maybe he should get together with "Fanny Batter" and
choose a less confrontational stance ;-)

5768. FA: UK - 1040ST with Spectre GCR Mac emulator!

Newsgroup: comp.sys.atari.st
Date: 2003-08-19 14:53:01 UTC
From: Richard Kilpatrick <richard@dmc12.demon.co.uk>
Message-ID: <wa6UEaUNnjQ$EwS3@dmc12.demon.co.uk>
Source record: 24300

Good condition 1040STFM with Spectre GCR Mac emulator. The emulator is complete with Mac ROMs and manuals, disks and Mac system disks, and fully working.

US buyers are welcome to bid; I will exchange the 1040ST for US shipping costs (i.e. win the auction and you can either pay US shipping costs for the whole system, which would be expensive and result in you owning a PAL, 240V ST, or I will cover the costs over the UK amount and send the Spectre GCR package without the ST).

For ST owners who don't know what the Spectre is - it's a Mac Plus emulator that is pretty reliable, offers most of the ST RAM to the Mac, and can read and write Mac 800K disks in ST drives! Check out the auction screenshots for an idea of how cool this is.

You need a mono monitor to be able to use it; I'm assuming most people will have one. I still use mine, but have offered it for ï¿½30 on the auction, likewise I've offered the upgrade from a 1040STFM to a 1040STE for ï¿½15. These are just options; I'd prefer to keep the monitor and STE, hence the prices!

Currently sitting at ï¿½2.70, which is a bargain for a relatively rare and unusual bit of kit in operational condition (no! Not the STFM! The Spectre GCR!).

I'm auctioning a load of my old computer stuff; I don't have time or the enthusiasm for them that I used to - but I'm keeping an ST around for old synthesizer uses!

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=richardk66

I will also consider a swap, if anyone is quick enough to offer.

My STE and 1040ST, plus Spectre GCR, for a MegaSTE. May have other things of interest, too.

Richard

Instead of vi he can also use Qed for instance. In "Show info"
([control]+[i]) one can change the kind of line ends in Atari, Unix and
Apple.

All,

Ill reply this in some kind of 3rd person, since i only wana explain my views on MiNT, why i like it, and why i think its prefered OS for Atari in future. "in future" explicitely means on newer hardware, hardware yet to come, ct60 etc.. Im not claiming this hardware will happen, but it was said there, that CT60 will never happen, but one is now ticking in my machine...

> On Mon, 18 Aug 2003, Dennis Vermeire wrote:
>
>> Because even the greatest MiNT die hard realised that Pine is ported
>> crap, and nothing beats a platform specific app?

Well can all that be twisted even more? Reason as may as well be the fact that even if there is Pine, those guys prefer Atari and know that all cant run Pine and they still wana contribute. I know thats the facty with Atack guys, they dont refer to pine as crap, but as great mailer. Also they say that they wanted to do usefull browser for GEM too because Pine cant run on most Ataris, they used many Pine things in Amail, also the importer of Pine mailbox, addresbook, and started on newsgroups as well, sadly we can only read news, and cant reply. They also did mintet, stik.. stacks. And the thing is even free.

> Pine a ported crap?
> What emailer on atari (not ported) supports IMAP? (yes I use that)
> Please do some research before you claim something to be crap.
> PINE is awesome because of IMAP, speed, low reqs (specially good on low

> a GEM viewer etc.
> Very powerful mailer, this is not crap, and has been available since AGES!
> Didn't have to wait for ash to release their mailer, half-assed.

Well i have divided feelings bout Pine. I do agre with Dennis that Pine aint native app, and that all services we like under GEM doesnt apply to it and that it is "alien" application, and in recent times i started to use AtackMail... On other hand, IMAP is very good feature, esp for modem users, also Pine has advantages like good spellchecker (ispell), good adressbook, newsreader and definately not a crap... Like Lonny said, calling it crap, just since dont use our GUI is insult to users and developers, and thats esxactly the part i disagre with Dennis! Especialy since he stretch that to all what he dont like/use... I dont like Magic, still i never did say its bad or that Andreas is bad... I even called it a "gem". And even as Andreas

said he did a mistake not to use layered design, i NEVER bitch about Magic's monolite design. It was prolly the best way to do it then, and he choosed that option.. By NO MEANS that make him lame... Dennis on other hand, use word lame, lamers, crap a LOT. Also must mention, that Dennis said that those apps (pine etc...) work better on PC anyway so no use to run them on Atari... thats TRUE Atari spirit. All is better as runing Pine on Atari (since it dont run in magic) even buying pc, or Mac etc.. Im a lot more happy with my TT runing MiNT and riebl ethernet card, acting like server with ip masquarading, so i had falcon pliped to it and accesed inet via TT.... I have MiNT installed, alien servers like ftp and apache httpd servers, and that is.. Still beats any REAL alien linux/windows servers, or inet gateways.. Im proud on my 100% atari hardware inet acces... Anyone saying thats LESS spirit as using other machines and put Ataris to closet, is just plain wrong. For end> TT being server still runs GEM, can be admninstrated via GEM, or just play games or anythings WHILE alien crap runing in bacground, transparently....

I would be VERY happy, if i could use similar native app, maybe a bit worse, but sadly Newsie has problems, MyMail also, so i did used Pine as mailer, later AtackMail and Knews (X11 newsreader) since it has great thread abilites.. I still run Pine as well, depends on mood i am.. Also i do use ircII (CLI). I find Airc great app, especialy VA_Start and stuff, but i dont use it. And i never called it crap, also Lonny knows i prefer ircII and ve NEVER had any grudge about it.. I still do test all new releases. And i also must explain why i use ircII: I love CLI, but especialy virtual consoles. That way i can run ircII, maybe Pine etc on virtual consoles, and have AES free for other apps. Im a lot on irc, Airc takes 2/3 of screen, i hate switiching or moving windows.. Other thing what i like is that vconsoles are indendent of AES, so if ircing or fetching large file from internet etc, i still may change resolution, or crash AES, which can happen frequently, esp if im coding, i can use full screen apps like Apex or Neon etc. Vconsoles and apps runing in them, dont exit etc, when AES is restarted or res change take place...

> Besides, because it is text based (ncurses), i can check my email,
> newsgroups from anywhere (from work for example) as long as I can telnet,
> or ssh to my machine, like if I was at home.

Yes SSH is big reason... It is very good to use machines remotely, and since telnet is mainly not used anymore, SSH is needed. If i enter Unix domain, which is not related to Atari, its still great to acces own machine from work, read mail, which in many cases, came directly to our machines, not on remote pop servers etc, maybe even do some maintenance.... Also need to mention SSL. Without that, u cant use e-banking etc.. and MiNT offers SSL to be used with CAB, not only with some alien app. Other problem is that CAB has probs with some forms and dialogs, esp things introduced after CAB developing stoped, but SSL support to GEM is done via MiNT.

> How do you do that on magic?

U cant... But that dont make it bad OS.. Its great little os, and by "little" i meant that in GOOD way... Its capable os, look nice, mtask as

its need to be done.. If u look so "great" Amiga OS, Magic does better and with a lot less resources.. Some things are missing, but nothing essential.

BUT, again, i need to say that all stuff i do like in MiNT, all which in my eyes makes it "better" as Magic are BONUS in MiNT. Atari feeling is not risked. I know many ppl, with Mtos like setup only (just kernel + naes), just to take advantages of loadable devices, like ext2 drivers, since, lets be fair, ext2 partitons are fast and rock solid. Long names also aint problem on them etc.. or just to use some inet drivers, maybe nfs. I do admit, that sometimes (esp net stuff) do require some fiddling with U: drive, but i NEVER dismissed anyone who asked for help if i was able to help. Dont forget, such driver, let say some internet protocol, can be compiled on MiNT easily and its ready to use.. Dont fell on "antipropaganda" that all that is just talk and dreaming, and there is no scsi<>ethernet drivers etc... Those devices are NOT free, and driver sources are NOT available, same as hardware specs for devices, so they cant just be compiled...

And again, those things are bonus and optional! U may use them or not, u may install full Easy MiNT or u may install just kernel + N.AES. The problem as i see it, is that MiNT, esp FreeMiNT and EasyMiNT are freeware, but N.AES is not. So atm, there is no distribution which would install AES as well. That means, that unfortunately, EasyMiNT installer installs MiNT and Unix envoriment, but not N.AES. so that must be done manualy... And dont hesitate to ask for help, we are NOT monsters, ppl wana show us as!

> You probably don't care anyway.

Yes, thats another thing which imho is bad.. "I dont need that. so i dont care" attitude... that dont help scene a bit.. imho, its destructive.... So if someone makes app for calculating popcorn baking times so what.. Better spen time and knowledge as the time spent for bashing him wht he did such useles crap...

> Oh, and btw, if pine was such crap, why does it even exist on windows?
> Or even macosx!!!
> Don't they have good mailer as well?
> The entire must be mad.

Good point....

>> See Janez, that's an example of what I just wrote.... you read things
>> into my posts that I've never written : I never declared MiNT shit, but I
>> did and do declare almost all the MiNT-specific things crap, shit, lousy
>> etc... almost all the Mint-specific stuff is ported and it shows, MiNT
>> isn't responsible for this, it's just an OS. And it's a pity really, it
>> deserves much better.

He didnt declare it shit... But he did declare it some other names, u declared Andreas Kromke the only capable coder left, and MiNT developers half brained loosers... To avoid mistake: Andreas is great coder and Magic is extraorindary product! But on other hand Frank Nauman, Konrad and company are good coders as well, they put BIG efforts so that MiNT can be

as fast as it is (run Linux on Atari for example) to implmemnt complete bios/xbios in, to even create new cals, and all in goal that MiNt will STAY Atari OS, not even one Atari app, clearly written dont crap on MiNT since developers cutted something out.. Now, how many Macos<X apps run on MacosX, without emulation, patches etc? Macs even came with both OSes installed....

Also remeber, he is a master of selective quoting... i NEVER seen any quoting in his replys, showing that i actualy said good things bout Magic etc.. or other ppl that is... He is one person agains many MiNTers here, yet word counting for crap, idiotic, etc, he would win easily....

> One thing you seem to forget is:
>
> Mint environment = all main GEM application + magic apps (most of them
> anyway).
> So in what way is that bad?
> Oh and let's not forget that ON TOP of that you can run a shit load of
> unix apps, at the same time as your GUI! with no need to switch anything.
> It all cooperate very nicely.

Yes! That is forgotten selectively.... SSL, ethernet drivers, nfs drivers and so on runs transparently... Any GEM application benefit from that. If u for example use NFS driver (network file system - imagine a virtual hdd, which via lan or internet is actualy HDD on remote machine, like your PC, or pals PC in XXX place, and u can access it like own hdd) any GEM app, including Desktop, will have acces to it, like normal partiton/path, only diference is acces time, which is as fast as your inet/lan acces. im my case (OZKs MiNT ethernec drivers and Stimps ethernec) thats up to 400kb/s to PC in LAN. U may say thats only inet drivers... but imho there is actualy real strenght of MiNT vs Magic/TOS. Inet changes, inet protocols change, ppp protocol change, cable replaces ppp, DSL, new protocols are yet to come and MiNT stack, and ability to load external devices alows us to adopt quickly.. I have my Ataris directly to cable for 5+ years for example. I dont go via PC, but directly (ok last few months via router, to have proper LAN)

> Do you know how cool it is to have papyrus, or calamus or whatever Atari
> GEM application running and in another window having some unix
> application?

Personaly i dont think that bare fact of running some X app in GEM is cool. Many X apps are bad, to say atleast, and better ones are quite demanding. But i am very excited, that we have software which allows to run alien apps on TOP of our native OS, without rebooting, ditching native GUI and so on. Even more exciting is, that MiNT, with its transparent features (here i mean drivers etc, not some ultra hyper cool port of an big application) allows us to run X apps remotely. That means binaries are executed on host machine, so they run fast, and display is redirected to GEM window... only limit is connection speed... Now, lets be fair, sense of such thing is questionable, but pure fact that its possible, its only available on demand (wont eat resources if u dont wana it) an not harm native OS/GUI or need reboot is very exciting... We have saying here, which

say something like this:"U cant miss things, if u have too much of them"
and i realy dont know why bonus ability should be bad...

One can say, that instead of adding extras to OS, coders should rather
develop apps... that may seems true, but, to make better apps, more
capable, u need to have better OS, especialy for GEM apps... Magic coders
did introduce new things, and only when that was done, apps, which Magic
comunity likes a lot, were possible to exist. MiNT coders are small portion
of coders, so we must ask others do do new stuff etc, not blame MiNT
developers bout lack of apps. Especialy since any clearly written
application will work on most Ataro OSes. I didnt do much GEM stuff, but
GGT2 i did in GFA, with Face Value in TOS, didnt spent 1s thinking bout OS
at all, and it works correctly...

>
> MiNT = what you've got + extra.
> (perfect combination if you ask me)

Yes. With one exception: it is resource hungry. All goodies i counted, can
be used on clone, or accelerated falcon... Accelerated more because ct2/60
have lots of FastRAM, not so much cause of CPU power,since Unix envoirment,
apps etc are ram hungry. But of course, speed is welcome, and no OS is
exception here.. Many "hardcore" atarians went MagicMAC because of power..
Many Magic fans ordered Ct60 as well. Odd, since here we hear that only
MiNT is sloooooooow.

> Some people are getting pissed because:
> Magic = what you use to have - some extra that don't work anymore.
> (otherwise GEMDOS FATAL ERROR)

Yes, and that what i realy cant grasp... We mention that we can runs some
extra stuff, and suddenly we are traitors, OS lack Atari spirit etc.. And
no bad words of those who for SAME stuff bought PC or MAC, or sent Atari in
closets or in bin and now use MagicMAC.. All that is perfectly okay, but
attempt to run those apps on our Ataris, is dreaming and so on.. But well,
Lindbergh was called dreamer as well, same as Wright brothers..

I LOVE my Ataris, i use them daily, lately i use PC as well for
newsreading and 3d astronomy apps, stuff i cant realy so far use on
Ataris, either cause lack of power or lack of apps. I love Ataris with
their bad sides, because they have so many good sides, because even today,
they feel the same as in days of glory... I use alien apps, and i use it
from simple reason, IF i have to use alien app (no matter if pine, outlook
express, whatwewer) i rather do that on my Atari. No one, using ALIEN apps
on ALIEN machine has right to question my Atari spirit, or spirit of those
developing ANYTHIG for Atari!! Thats all...

Janez

P.S> Forgot this: even XAAES got its share of critics. Magic fans, MiNT
haters, Dennis, instead of bitching, and moaning and cursing, try to
contact XAAES authors, or mailing list and suggest changes, what ud like,
what u dont like... It is AES in making, oportunity to add, and make it

more likely for u... Same for Highwire, instead of ranting its bad offline browser, contact authors and try to make it better... That is one of good things with open projects.

If you said "arse" previously, I never seen it. I wouldn't worry about it as others seem to throw that or worse words around as easily as "the". Don't worry about the spelling, everyone gets my name wrong anyway, I'm used to it.

I think your work has great value, I always have. I'm certain I've downloaded something from there at one time or another.

> I'm not addressing this to you in person Lonnie, but in general, as I'm fed
> up with posters apparently coming out of the woodwork to deliver some jibe
> or other and then nip back again.

As am I. I am totally open to the fact that there are apps that don't run on my setup, but I respect the fact that others can use them and find them useful. I also respect the effort that went into them even if I cannot use them. I simply do not use them and leave it at that.
The constant negative feedback aimed at mint, mint groups, or whatever wording is getting really old. In fact it is Dennis who perpetuates the split.

> I'm strongly reconsidering how much effort I'm prepared to put in supporting
> the Atari community.

If you really want to cut back on the effort, just dump the trouble maker from the group. Only takes one bad apple to spoil the rest. Mind you that is only a suggestion, but the constant ranting is not helping matters at all.

Opinions are one thing, I don't care if they thinks stuff is crap, but at least take into account that others use this stuff on a regular basis.

Telling him to drop the sig, and then letting him run a muck on his own is one solution though. Hope it solves the problem for you.

Let me add there are 2 unix irc clients available for mint, I recommend
people try them. I even like ircII (has scripting and all), but since I
have huge screen, aIRC is good enough. ;-)
Nice post btw.

Does anyone know what happened to this project? I was going to build
a 44.1 external clock (and possibly a 40 as well, since the NOVA
doesn't appear to be working with the CT60), but the link disappeared.
I'd be happy with a schematic or an address to send my $16.

Galen

It's clearly almost all dennis, please don't lump them all together.
Nearly all those are aimed at me. I don't read all his posts, I pick
what I want to respond to and ignore other ones, much like he bobbles around
on topics. Needless to say, the foul language is a sign of weakness.
They think they can run people out of here, well it won't work with me.
Certain people here need to adjust their attitude, learn to skip posts or
get a mailer than can automate post skipping. I am not going anywhere.
If I'm so full of "it" then why the harsh replies, go figure... ;-)

The point is that the buyer paid the amount of his own free will and boy did
he leave with a smile on his face, he didn't have to make Derryck an offer.

I'll not disclose the amount concerned, i was told in confidence, suffice it
to say "In your face big-time" to My k unt.

He point is you can set a price of your own free will and the purchaser is
free to accept or negotiate, the final deal is a collective decision.

> Think it is highway robbery??? Read the signature at the end then

Steve,
I totally agree with you 100 percent!!!!! I have a CT60 installed and an Eclipse Graphic Card. A 40 GB IDE Maxtor and soon a 120 GB IDE Western Digital with the 8 MB cache. I also plan on getting the CT60 Graphic Card and any adapters or such that R. Czuba plans on making. In the end I would probably not let mine go for less than 1500 dollars once my system is all upgraded. For those of you do not know, I have a 24X Cyberdrive and a 10X4X32X Sony CD-Burner and a 4.5 GB Seagate Barracuda all of the above are SCSI. I have a DSP external clock and a EtherNEC card for the Cartridge port and a 19 inch Samsung 955DF VGA monitor. All totalled this to me would not go for any less than 1000 dollars easily. As stated above with all other upgrades to me this is a 1500 dollar computer easy and non-negotiable. Did I mention the 060 is a 60mhz. version FULL??? But your right Stive about one thing stated in all of these post it is negotiable only to the people who are selling and the few people who are interested in buying or purchasing the computer.

Long live all Atari computers!!!!!

Thanks,
Carey Christenson

Hopefully, when you get that gfx card you can bump it up to 80 columns. ;-)
Seriously though, any particular reason for narrow columns?

Hi All
I have one of these that has not been used for quite some time and was told in the past it was worthless but in view of some posts on here it would seem it is still a sought after machine.

It has 16 meg of memory, a Nemesys accelerator and a 3gig 3.5 inch hard drive squezed into the orignal case, I am not stating a price but would like offers here if poss, that way others could see the offers and I think I could get the best price.

I would prefer the buyer to see working and pick up in Lancashire as I would not trust an irreplaceable Item like this to the post

Sausages

5800. Stacy 4 for sale.

Hello.

I have a Stacy 4 to dispose of. It came in as a non runner after the owner tried to fix it himself but will boot to the desktop from floppy.

The hard drive is toast and binned but the driver card is present but not tested.

The screen is also present but not tested.

I think it's worth £50 for spares so offer are invited.

UK shipping will be £10.

5804. Help? STe going loopy

Newsgroup: comp.sys.atari.st
Date: 2003-08-20 18:25:35 UTC
From: trevorcjspencer@aol.com
Message-ID: <20030820142535.23307.00002392@mb-m29.aol.com>
Source record: 24336

When I switched on the Atari the picture on the monitor, a Microvitech Multisynch, started looping, and I assumed it was the vertical hold as per a TV. When I checked with my spare STe however the monitor was fine so presumably the fault must be with the STe itself.

I'd like to canabalise the appropriate part(s) from the spare STe because the one I use is heavily modified, e.g Veloce 68020, 4Mb ST ram + 2Mb TT ram, modified serial port, HD floppy drive and so on.

The Atari is still in regular use on the net as well as for many other things. I'd appreciate any ideas so that I can keep it going,

Trevor

Hello Rustynut, Lonny,

Thanks for the comment. I think it could be a good discussion forum and
the software hosting it is pretty damn good.
If you didn't know, you can change the theme to change the full appearance
of the forum, some of them are really nice, try it out.

Don't hesitate to advertize your website (commercial, software, freeware
whatever).

You can also assign your ID with an Avatar, be creative :)

Right, and the RS-422. If your comm port stop working, the TL 497 is a
good place to start looking....Feel how hot it runs when powered up.
Tip, if RS 232 burns out, use chip out of RS 422, no one uses that:)

>> and run AHDI from the floppy but I get a message saying "ID unavailble"
>> "not bootloaded".
>
>How long has it been since you've used the system? I've heard of
>similar stuff happening when people haven't used the system for a long
>time, or have just moved. It sounds like a flaky connection

Hi Julian (& Uwe if your listening :)
Without opening anything, ICD now boots the Megafile and shows 4 GEM
partitions but AHDI shows "ID unavailable". HDDriver shows "no partitions
found" at boot-up but Device check shows it as available. ICD's utility is
showing 1/3 of drive C as haviing bad sectors /:)
It seems to me that if the other partitions are the same as "C" and I
can mark the bad sctors and re-partition the 4 into 1 then the Megafile may
be only useful as a boot drive (or the trash)!
But, why doesn't AHDI or HDDriver boot it when ICD does? Too sensitive
to so many bad sectors or still a hardware problem? Note that Diamond Edge
shows the partitions as Atari and not ICD.

They might see other bad sectors. I have had such a problem with an old
Megafile once, where the position and number of bad sectors varied with
each access and the temperature of the drive.
A drive that has so many bad sectors is severely damaged and I would not
expect a constistent behaviour.

5820. Graphics routines in C

Newsgroup: comp.sys.atari.st
Date: 2003-08-21 08:37:00 UTC
From: LAFABRIE Florent <lafabrie@club-internet.fr>
Message-ID: <3F4484AC.6030503@club-internet.fr>
Source record: 24401
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

Taking again the programming of Icon Extract after several tests for Rodolphe on the CT60, I will like to know if one among you know some routines of transfer of pallet of 256 colors towards another 256 colors. I am explained: by reading the pallets of the Windows icons to format ICO, CUR, and ANI, the pallet 256 colors is always different from that of Falcon. It thus should be adapted to just, my current routines try to find color RVB nearest and that functions well. I will want to optimize the speed of the treatment and I am certain that there is an algorithm already existing faster than mine. I search on Internet, but I anything out of C would you have do not find sought some tracks?

In the same way, I use my routines to transfer from the icons 24 and 32 bits to 256 colors. The more there are colors, the more the treatment is long to find value RVB corresponding. Also, if you have tracks (without using options of dithering), you would help me well. Thank you for your assistance.

Florent

Hi Uwe,
What you state is confirmed by ICD not seeing partitions now either!
Oh well. It was an adventure trying! I'll put the Megafile on the shelf
with other doorstops (Cristmas fruitcakes, etc.).

Thanks for the feedback,
John G.

Hi mike,

>and a U: drive capable of long filenames in its root directory (which I've
>yet to get Magic to do)

It seems to me that you need to get MagiC to do a lot... until a couple of days ago you never heard of #_TSL and now this... before commenting on the flaws of MagiC, you should first configure it correctly.

>At any rate, I agree. This bickering is stupid. I can't stand watching
>elitist attitudes causing arguments that 1. aren't productive, and 2.
>can only do harm to the platform.

1. I've never seen a productive argument in here :-/
2. Explain how these discussions could harm the platform, CSAST isn't the platform, it's just a very tiny part of it...

If one doesn't like reading this discussion he can apply filtering, someone reading it agreeing or not with the expressed views is interested otherwise he wouldn't be following and reading the thread(s). All what threads like these can do is damage certain people their enormous ego's... in my book that's a good thing ;-)

>I can run PhotoTip and the unix alternatives, and regardless of what
>Dennis thinks, the main issue is getting the dam images off the camera.

One doesn't even need a program to get the "damn" images...
PhotoTip has the unique ability to turn the combination printer/scanner
into a monochrome/colour photo copier, that feature alone is well worth
the money... so where's the free ported unix alternative?

>It's just like in 'The Matrix', the problem is "choice".

In this particular case there is no choice...

>I can post process them with any number of graphics apps later.

Sure you can... and since everything originating from this platform needs
to be avoided like the plague, you'll probably use some ported crap for
that also.

>Why they can't let the other side live in peace is beyond me.

Because you spread FALSE information, someone who never heard of PhotoTip
won't even look at it after reading your brainless drivel... as long as
you and some others here keep on cheering that ported crap which offers
nothing more, on the contrary, then the "real" thing I won't let you live
in peace for one single day. If that's beyond you....

>It is a piss poor attitude for sure.

It takes one to know one... :-)

8-21-03
HOTZ BOX PHOTO GALLERY added
Go here (http://tamw.atari-users.net/hotzbox) for the The Hotz Box Photo Gallery These photos were supplied by Joe Ruszkowski who was/is selling his Hotz Box. They show many details on the Hotz Box including the many aux outputs, MIDI ports and the rather large Atari logo!

Thanks Joe!

BTW: on my home page you will notice I have a News section now. All updates will be added here as well.I have also updated my music page with more MP3's showing off Pulsar, Autobusk and Tunesmith.

Hey everyone, I just wanted to let you know that I have an online vintage computer and console shop called Vintage Fun World. I have an area dedicated to the Atari ST line of computers there, so if you're looking for something for the Atari ST I might just have it. I'm just starting to accumulate an inventory for the ST, so it's a bit small right now, but it continues to grow. The website is: http://www.vintagefunworld.com

Thanks.

5842. MagXNet is turning me crazy :-(

Newsgroup: comp.sys.atari.st
Date: 2003-08-21 21:30:08 UTC
From: Jean-Luc CECCOLI <wdwd@wd.com>
Message-ID: <WS3.159bb03f.878856e2.wdwd@wd.com>
Source record: 24424

And WENSuite doesn't help things going better! :-(

Hello,

This is the 6th time I write this - and I hope this time WS will
not crash and ruin my work! :-(

Well, I still can't make MagXNet work on my TT, tough the
parameters are the same as the ones used for STinG, which works
fine! So, I would greatly appreciate any kind of help that
could make me progress ;-)
And, in order to avoid useless questions, here is what I did :

```
- \START
+MAGXCONF.PRG
+MAGX_RC.NET, containing
etc_path D:\ETC
ifconfig lo0 addr 127.0.0.1 up
# My TT's ip and subnet mask
ifconfig en0 addr 192.64.1.2 up
ifconfig en0 netmask 255.255.255.0
# But... where's the route ?
```

```
- \XTENSION
+ENEC3.MIF
+MAGX_SLD.OVL
+SLIP.MIF
+SOCKETS.DEV
```

```
- D:\ETC
+DOMAINNAME, unmodified
+HOST.CONF, unmodified
+HOSTNAME, containing
TT030
+HOSTS, containing
127.0.0.1 localhost loopback
192.64.1.2 TT030 en0
+NETMASKS, containing
192.64.1.0 255.255.255.0
+NETWORKS, unmodified
+PROTOCOLS, unmodified
+RESOLV, containing
domain localhost
nameserver 127.0.0.1
+RPC, unmodified
+SERVICES, unmodified
```

As I only intend to link my TT to a PC (192.64.1.1) and a laser
printer (192.64.1.9) via a hub, I didn't bother with domainnames.
Once again, with STinG, I can ping the PC as well as the printer.
Now, what happens with this configuration when I launch the
utilities in \tools :

* ifconfig (with no parameters) returns the following :
lo0: flags=0x4b<UP,BROADCAST,LOOPBACK,RUNNING>
inet 127.0.0.1 netmask 255.0.0.0 broadcast 127.255.255.255
metric 0 mtu 16384
....
en0: flags=0x43<UP,BROADCAST,RUNNING>
inet 192.64.1.2 netmask 255.255.255.0 broadcast 192.64.1.255
metric 0 mtu 1500
....

This *BROADCAST* next to en0 tends to puzzle me... your opinion ?

* route (with no parameters) returns :
Destination Gateway Flags Ref Use Metric Iface
127.0.0.0 * U 1 0 0 lo0
127.0.0.1 * UH 1 0 0 lo0
192.64.1.2 * UH 1 0 0 lo0

if, then, I type
del 192.64.1.2, and
add en0 192.64.1.2, then, after I type
arp add 192.64.1.2 00:00:b4:80:cd:e1 perm
the 3rd line becomes
192.64.1.2 * UHD 1 1 0 en0
and arp, as is, returns
192.64.1.2 0:0:b4:80:cd:e1 2 0s PRCOM,HWCOM,PERM

which, IMO, sounds a little better - but still doesn't work :-(

Well, I'm almost sure it's nearly nothing, but I can't find the
reason why it doesn't work.
So, please, anyone, help me!

Thanks in advance,

J.-Luc

Nice site... I just placed an order for a couple of harddisks and the
"online shop" worked well using CAB. No offending Javascript and PayPal
support makes a good combination.

Now I'm just hoping the harddisks are bootable and that this guy is of
the honest type...

Are you trying to get a dial-up connection, or other kind of network?
I have MagXNet working just fine on my Falcon for a dial-up
connection. I haven't tried putting a local network together yet, so I
couldn't help with that. Another place to try searching would be Unix
newsgroups, since the configuation of MagXNet and MintNet is basically
a Unix networking setup.

If you are just trying to get a dial-up internet connection, let me
know, and I can send you an outline of my complete setup. It would
also help if you sent me all of your MagXNet files to see if they're
set up right (passwords omitted, of course).

Yes I have considered that as well. I normally use Everest (I just happen
to like its simplicity). It too can save as Unix but I may have missed
a file. I will check again.

The ppd rpm that I have does not have a file /etc/sysconfig/ppp.config
but I think that the NFL documentation refers to one.

My gosh Dennis,

Why would you need a unix alternative if a better GEM version is already
available??
Do you understand that concept?
Use the best tool for the given task.

Just run the freaking phototip under mint and be done.
What's the problem?

>
> >It's just like in 'The Matrix', the problem is "choice".
>
> In this particular case there is no choice...

why? care to explain that one?

Just showed to you that you can run the GEM applications + the ported one
if you feel the GEM ones don't cut it, and you are talking about having no
choice?

So the images stored on the camera just magically appear on my HD?
PhotoTip is a program. That is it's main purpose, to access serial
based cameras. Without that feature it would pale in comparison to
other such printing/scanning apps.

>> PhotoTip has the unique ability to turn the combination printer/scanner
>> into a monochrome/colour photo copier, that feature alone is well worth
>> the money... so where's the free ported unix alternative?

The other apps I have already do this, PhotoTip is a fine app, just
the so called extra features I don't need. I don't have any problems
opening a CLI and entering something like "camedia -modem2 -d"
or whatever. Five minutes reading some docs and I've accomplished
my task and saved some money as do others on different platforms.

Where are the unix ports? Wow, short term memory. Tried looking
on the SpareMiNT page? Of course not, too easy.
The next complaint will be that they are stored in RPM format.
Round and round we go, where it stops no one knows. lol

>>> It's just like in 'The Matrix', the problem is "choice".
>>
>> In this particular case there is no choice...

There's where you are wrong. You just think you have no choice, since you
took the path you took. It wouldn't kill you to have a dual boot system.

5851. Milan 060 for sale

Newsgroup: comp.sys.atari.st
Date: 2003-08-22 05:21:15 UTC
From: gaiyan@atari.org
Message-ID: <384396f2.0308212121.6022b307@posting.google.com>
Source record: 24433

School has started for me and it is taking up all the little time and resources that I have. So I have figured it is best for me to sell my Milan 060. I am doing this very reluctantly as it is a great machine and I have enjoyed it immensely. The sale would be for just the board, cpu, ram, sound card, and gfx card. The specs are:

Milan motherboard
68LC060 66Mhz
060 adapter
64MB Ram (4 x 16MB)
S3 Trio64v 2MB
SB 64 ES1371

Best/fastest offer gets it. I am located in Finland. I will ship to anywhere in the world.

Joshua.

Source record: 24436

Hi All,
Well, the megafile didn't turn into a doorstop (yet!). I opened it,
pressed on the chips and connectors and will do the same with the MegaST4
(when my next burst of motivation hits). After numerous attempts at booting
with HDDriver (8.04) it started to respond using Device Check in the APP.
So I went ahead and reformatted it (before it died again) and partitioned
it. It still takes a few resets for it to boot but it's a bit stable now.

Thanks all for the help,
John G.

> 1. I've never seen a productive argument in here :-/

Polite discussions and disagreements are productive. "Productive argument" is an oxymoron.

> 2. Explain how these discussions could harm the platform, CSAST isn't the
> platform, it's just a very tiny part of it...

Dennis, first let me say that I really appreciate your groups translation of vatious apps, I think that your work is some of the most productive and helpful that our platform has seen. I'm also a Magic and Geneva(sp?) user. IMHO, Magic has been one of the most useful advances in our small world. I am also interested in trying the new forms of mint, ect., I also think that new hardware and capabilities in hardware are ultimately an important part of the continuing life of any platform.
Harm can come to our platform from the tone, rather than the content of discussions. A discussion that contains any sort of distain or belittlment is what I would call an "argument." I don't know, but suspect that you have been subjected to a lot of negative tone throughout your time, but I submit to anyone that it is counter-productive to return to anyone in kind. I'm a musician, and my interests and needs are different from others. Cuebase Audio Falcon and the soundpool apps are the main reason I'm still useing my Falcon. (I've got 2, 1 with a CT2B, another with a Nemisis awaiting installation of my CT60.) I love MagiC dispite the fact the CAF will not run on it.
By all means, discuss and politely disagree with people when your knowledge and experience lead you to think otherwise, but if you "sink to their level" by ingaging in disparagement or distain, the larger number of people who read rather than participate in these newsgroups will (1. give your opinions less validity, (2. be less willing to participate in discussions for fear that they will also be subjected to negative posts. We are all ignorant about something. Ignorance is not stupidity. (Not that I think you've called anyone stupid, lazy, ect...)

As I quoted from a barroom picture, showing 2 angry, shouting, gesturing men, "It makes no sence to argue with a fool, because onlookers can't tell which is which."

Lyndon Amsdon <lyndonamsdon@hotmail.com> wrote:

>How about a Peltier device between the '060 and the water block?

What for?

A 060 can be easily cooled with a normal heatsink plus moderately slow fan -
in a good design, the fan that cools the case could also cool the 060,
without generating additional noise.

A peltier device produces more heat inside the case, and gives no benefit
since the CPU is cool enough without.

I have MagxNet working together with an ethernet network FWIW, IIRC you just change the default route to point to your ethernet port rather than the modem.

> +MAGX_RC.NET, containing

This is mine:

```
# Where is your /etc path (please use a VFAT partition)
etc_path i:\etc

# Absolutely necessary!
ifconfig lo0 addr 127.0.0.1 up

# Serial lines ( if any is to be used )
# iflink -i sl0 -d u:\dev\serial2
# ifconfig sl0 addr 44.154.0.26 dstaddr 44.154.0.28 mtu 1500 link04 up
# ifconfig sl0 netmask 255.255.255.0
# route add 44.154.0.28 sl0

# Ethernet adapters
# Falcon
ifconfig en0 addr 192.168.1.4 up

# Laptop
route add 192.168.1.3 en0

# Pulsar
route add 192.168.1.2 en0

# Pulsar2
route add 192.168.1.5 en0

# Default route for Masquerades, NATs, proxys etc
# Router/Gateway
route add default en0 gw 192.168.1.1
```

> # But... where's the route ?

Each computer in my network has its own address as listed above; with
255.255.255.0 as subnet and 192.168.1.1 as the gateway (my router). If you
don't have a router I don't know what goes there, perhaps it doesn't matter.

> +HOSTS, containing
> 127.0.0.1 localhost loopback

I have these listed in mine, as well as the localhost:

192.168.1.2 Pulsar
192.168.1.3 Laptop
192.168.1.4 Falcon
192.168.1.5 Pulsar1

> +NETMASKS, containing
> 192.64.1.0 255.255.255.0

Mine doesn't seem to have been changed from the orginal file.

> +RESOLV, containing
> domain localhost
> nameserver 127.0.0.1

Mine has settings pertaining to ntl's dns server.

> As I only intend to link my TT to a PC (192.64.1.1) and a laser
> printer (192.64.1.9) via a hub, I didn't bother with domainnames.

I'm intrigued by this, how will you print to this laser from your TT?

Anyhow, I'm not at all expert in any of this but it all seems to work.
Biggest problem I encountered was failing to unpack MagxNet to a LFN
partition...

You might need Link2U.prg as well to make all this work properly.

Hi guys,

I am an MSX freak, but I also like some other old computers including C64, Sinclair, Amiga and Atari. I have a problem with my Atari 1040ST, so I hope I will get some help in this newsgroup.

I downloaded a lot of .ST images from some German site, they work find under emulator, but I can't transfer them onto a diskette with MAKEDISK utility. Is there any other way to create Atari floppies using .ST images and PC? Are old Atari disks available in some other format?

Maybe I am doing something wrong with MAKEDISK, but I can't make a single diskette. Please help the newbie.

Problem solved with STDISK utility and some help from 8-bit Atari
newsgroup (thanks Tim). I even managed to make this utility work from
Windows XP. ;)

BIG thanks to the author of STDISK!

Now I would like to ask you guys the following:

1. The shell (Amiga-like GUI) that my Atari boots into is in Dutch (or
some similar language). Is there any way I can switch to English version
or get an English version of this shell on a floppy ?

2. Is it possible to change the default colors (white-green) to
something less disturbing ?

3. I use Philips M8833 II monitor and it looks like it doesn't like the
Atari's signal intensity - when the screen is filly white, I see some
disturbance in the right side of the screen. Did anyone have the same
problem ? (I built a simple RGB cable and connected R->R, G->G, B->B,
CSYNC->CSYNC between Atari 1040 and the monitor).

Thanks in advance.

Source record: 24252

Hello,

First, I must thank You who spend time helping me.
I found the issue with the Lantastic, and read it thorougly.
I went on Chapelie and downloaded MintNet too.
I read, examined, then read again, compared... but still couldn't
find anything that could cause MagXNet not working on my TT.
I even moved the etc folder to i:\ (and modified the conf file
to match it!), but still nothing.
Then, I did try a last thing : I opened the files networks and
hosts, and replaced all tabs or multi-spaces by single spaces.
Then, I rebooted and still couldn't get it working.
I changed from enec3 to enec in the XTENSION folder, but it
didn't change anything.
Then, I made an archive containing the files I use, and was typing
a mail to Edward, and as I needed to describe what happened when
I tryed to ping something else than the localhost, I launched
ping.ttp and typed "laser" (unquotted, of course!), and, at my
great surprise, it worked!
Since then, I can ping whatever is tied to my hub! I rebooted the
TT, switched it off, the printer, the hub... whatever I do, it
now works - the leds of the TT and the pinged device blink
together on the hub!
So, I think I will let it as is, and hope it will gon on working
with no problems.

J.-Luc

Who still wonders what can have been wrong so far, anyway :-/

Note that EtherNEC has some timing(?) problems when used on a TT. If you
got it working keep track of how it is installed as at least with STinG
it is very dependent on physical order of drivers in the STING folder and
TT RAM settings on the modules. It may work from Magic but not TOS or the
other way round. On some TT's it seems impossible to get EtherNEC working
at all.

Hello,

I have a couple of these to sell, I think they would work in a Nova or Milan/Hades. I can get some photos if that helps, dated 1995. They have 2MB each. So good for 1024*768 in 16bit, or maybe 1600*1200 in 8bit.

Offers really, bought them to develop with, going to keep one still (I have three).

I also have my Falcon casing, it is in excellent condition with shielding and original Falcon cardboard box packaging. Again offers.

Thanks, Lyndon (UK)

> some similar language). Is there any way I can switch to English version
> or get an English version of this shell on a floppy ?

The OS is stored in two (or sometimes six) rom chips inside the machine. To change the OS, you need to find rom images, and a friend who owns an eprom programmer, and make replacements.

However, I'd doubt if you have a foreign OS in your machine unless you actually bought it abroad. The thing is, most atari disks have a desktop settings file, which stores your desktop options and loads them on bootup. If the disks are german (are you sure it didn't actually say "Deutsch"?), the odds are the desktop settings are all in german too. Try booting up without a disk in the drive (it will take a lot longer). If the desktop is in english then you've got an english OS. If it's STILL in German, then you've got a german OS.

>
> 2. Is it possible to change the default colors (white-green) to
> something less disturbing ?
>

Only in much later versions of the OS - and you'll need an STE to use them. Remember, these are old machines, and the GUI will appear primitive by todays standards. I've heard it said that some third party boot-up programs were made to allow you to have background images and screensavers and stuff, though. You'll also find that most enthusiasts are quite fond of the colour scheme.

> 3. I use Philips M8833 II monitor and it looks like it doesn't like the

> CSYNC->CSYNC between Atari 1040 and the monitor).
>

Here's what I think the problem is - sources disagree on exactly what the "csync" pin on the atari does. On my machine, it actually appears to give a composite video signal, which would explain the sync problems you've been having - bright images make the sync pulses on the composite signal hard to tell apart from luminance. By advice is to forget that pin, and instead use the separate horizontal and vertical sync signals the Atari puts out. If your montior only has composite sync input, you'll need to find a circuit to combine the signals before they go into the monitor. There are several out there, as quite a few classic computers have this problem of combining or splitting sync signals for driving various monitors.

* Please excuse if this posted twice! It's been over 24 hours. Either it never arrived or my news server isn't getting all the posts! Does anyone see it twice?

Hi All,
Well, the megafile didn't turn into a doorstop (yet!). I opened it, pressed on the chips and connectors and will do the same with the MegaST4 (when my next burst of motivation hits).
After numerous attempts at booting with HDDriver (8.04) it started to respond using Device Check in the APP. So I went ahead and reformatted and partitioned it before it died again. It still takes a few resets for it to boot but it seems to be revived!

Thanks all for the help,
John G.
P.S. My apologies to Uwe for my un-educated comment that HDDriver was no good on the Megafile!

I have the EEPROM programmer. Are these chips on 1040STFM detacheable or
I will have to cut them out of the board ?

The thing is that I don't have any floppy disks with desktop settings. I
can boot only to GEM that is in ROM. If someone could send me an image
of an English GEM disk I would be very greatful.

> Only in much later versions of the OS - and you'll need an STE to use them.

Thanks for the info. That little disturbance is not a problem unless it
can damage circuits of Atari or monitor. Fully white screen is quite
rare event, so I think I can live with it.

5877. ADV: fixed a mouse

Newsgroup: comp.sys.atari.st
Date: 2003-08-23 18:34:34 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <bi8c3qcpq1@reader2.panix.com>
Source record: 24259

I fixed a mouse with a dead button. The switch itself is $0.18 USD. By the time you pay the minimum order charge, and shipping, it costs nearly $10 USD. So I bought 25 of the things, which will last me several lifetimes.

If anyone wants one, considering one thin dime for my expenses in getting to the post office, and spending a quarter gallon of gasoline, it will be $0.70 plus a suitable shipping envelope for a little thing with sharp leads, and postage.

If you want to do it all yourself, it is an Omron, and the cheapest one in the DigiKey catalog.

Jim

The roms are always in sockets, but on later machines with the larger rom sockets there are sometimes jumpers, which are actually soldered in position, to tell the machine what size of rom chip you've installed. Be warned that downloading TOS rom images is illegal, although I doubt anyone would kick up much of a fuss if you're simply switching to a different language of the same version you've already got. Also, if you do plan to do this, the single OS file will need to be split into two halves, one on each rom, one containing odd bytes and the other even bytes. There should be "HI" and "LO" printed on the motherboard in two-chip models, corresponding to the odd and even addresses, respectively (If it doesn't work, I could have got that backwards, in which case try swapping them round - you can't damage the machine doing that) There are programs out there that split the file, but they can be very unreliable. In particular, some TOS versions are bigger files than others, and some splitter programs whcih were designed for the smaller ones tend to stop before they reach the end of the file. Infuriatingly, many of these programs are also written for TOS, so you need another working Atari to use them! Your eprom software might have the ability to do this automatically - it's a standard trick for using two eproms to hold a large file with minimal additional address circuitry.

One final warning - the Atari ST series casing, while very compact, rugged and aesthetically pleasing, is an absolute nightmare to dismantle for upgrade or repair. To get at the roms in early models, you'll need to remove, in order: the top half of the plastic outer casing, the keyboard, the disk drive, the power supply RF shield, the power supply module, and the upper motherboard RF shield. On your first try, this will probably take at least half an hour. On later models, the Atari engineers realised the stupidity of the design, and moved the roms to beneath the disk drive, so if you're lucky enough to have a later model, all you need to do is open the case and take out the disk drive and keyboard - which is good, because the main RF shield is virtually impregnable. Even so, be SURE that you need to

change the OS before going through all this.

I'm not sure you understand - the desktop preference file only contains things like the preferred resolution on startup, names and positions of drives, and stuff like that - even using one of these files, the OS loaded is still the one in rom. And the preference file is usually included on practially EVERY Atari disk, regardless of whatever else is on it, so you don't have to faff about putting your preference disk in on bootup and then switching to the disk you actually want to use. If the disks you've got were saved on a german-os machine, the desktop files on them will still load properly on an english-os machine, but the trashcan will be called "papierkorb", and stuff like that. I'd be very surprised if the disks you've got don't have preference files on them.

The conclusive test is booting up with all drives physically empty - whatever language the desktop is in then is the language of the os.

I wouldn't recommend getting the OS on disk, though. While the machines are capable of using these, they load the entire operating system into ram on bootup, so you can then remove the OS disk and put in your application disk or whatever. Understandably, this takes a massive bite out of your available ram (which aint that much - 1MB on a 1040, unless it's been upgraded), and will cause problems with any large programs that need lots of memory.

> Does anyone still have these boot-up programs ?

Not me, mate, sorry. I use my machine exclusively for games, and since they always start immediately on bootup (Autoplay's nothing new, you know!) , I rarely see the actual desktop. But give it a while - you may get used to it, and those programs will all cost you valuable ram and processing time, for nothing more than a pretty picture (although this argument does, on reflection, have some relevance to computer games!).

Almost guaranteed not to damage the atari, and very unlikely to wreck the screen. But it's not much trouble to combine the signals - I think you can do it with just two diodes and a resistor, effectively making an M2L OR gate.

Success. I found some rogue cr/lf in /etc/ppp/chat and my isp address
was wrong. My isp uses a different address for the broadband connection
that I use from home.

pppd now dials in to my isp and makes a connection displaying
the local and remote ip addresses. Also I can ping the remote address :-)

With Gluestik running I expected to be able to use CAB or MyMail but
neither responds. It works ok with my broadband router but I can't
test that here.

A bit more troubleshooting is needed.

Regards and thanks,

Peter

Oh please, Dennis...let's be realistic about this. Atari users play with apps for the hell of it, and everyone here knows that. And stop contradicting yourself...if CSAST is such a small part of the scene, why would anyone make a decision not to use an app based on one user's post in a very small part of the scene?

The fact is, ported or not, any app for the Atari platform is good. It's more apps, and more choices. Undeniably, this creates scene traffic, which is another good result.

This argument is completely bogus. Give it up.

Julian

> since the CPU is cool enough without.

At 66 MHz I can work without fan, I obtain 50 degrees, but at 30 degrees
and 69.7 MHz my 68060 crashes so watercooling is a good idea for me.

Now I have moved the cooper radiator for get external air (not inside
the tower like the photo), and removed the base of the Rodolphe's
radiator (1mm) so the waterblock is on the 68060 surface.
I have updated the photos.

Atfer 5 hours, I obtain good results inside my closed tower :
Room : 26 degrees
68060 : 26-27 degrees
Tower : 28-29 degrees.

Before, with a the 486 fan, inside the 060 I had 32-34 degrees.

I'am happy my CT60 works fine now at 69,7 MHz :-))

Regards,

Didier.

I've never had a Nova, or even seen one. The cards work fine in a PC
ISA slot, thats why I said I can provide further information on the
chipset or photos of it. If its anything like the Eclipse, only some
ATI cards work. I do know the ISA version is rare, I had to buy some
from USA.

>views on MiNT, why i like it, and why i think its prefered OS for Atari in
>future. "in future" explicitely means on newer hardware, hardware yet to
>come, ct60 etc..

Nice start for a posting :-)

>Dennis on other hand, use word lame, lamers, crap a LOT. Also must mention,
>that Dennis said that those apps (pine etc...) work better on PC anyway so
>no use to run them on Atari... thats TRUE Atari spirit. All is better as
>runing Pine

Whoops! you've just missed a bend, what happened to your initial intentions
about explaining your views on MiNT?

>Like Lonny said, calling it crap, just since dont use our GUI is insult to
>users and developers, and thats esxactly the part i disagre with Dennis!

Whoops! you've missed another bend.... sorry, game over. :-/

There are two reasons why I call it crap, the biggest reason which you and
Lonny like to overlook is that these apps only run on one of three major
used OS's... and yes the second reason is that I like to use apps with a
GUI... I don't like apps which are OS-specific, I don't even like MagiC-
specific apps, luckily there are only a handfull of them (the Iconnect
clients). It took a while before MagiC developers realised this and were
told that MagiC-specific apps were not the way to persue on this platform,
and now it's time someone tells the MiNT-community the same thing, because
they are making the same mistake (yep, I call it a mistake). If you really
so worried for the future of this platform, then it should be crystal clear
that supporting only one OS can only lead to a lot of people turning their
back on it. Developing & porting apps that only run on one OS, will leave a
lot of people standing in the cold, and they'll look for a warmer place. We
all agree that MiNT really needs a powerfull setup, and since it's only a
small minority who happens to have and enjoy such a setup....
So yes, I refer to OS-specific apps which on top of that come with no GUI as
crap... so what? What's in a name? Would you like me to call them in future
"Apps I rather don't use"? Let's call a horse a horse.... you would flame me
just the same for not respecting the work of the author and the community,
the thing is, you don't want to see anything negative written about that

stuff... Like I said before, you like us all to cheer and be gratefull to
who ever ported it....sorry Janez, can't to that :-/

>Dennis on other hand, use word lame, lamers, crap a LOT.
>
Yes I did use them a lot, but that's because you and others here kept
dishing out a lot of stuff that deserves to be called like that.

>Also must mention, that Dennis said that those apps (pine etc...) work
>better on PC anyway so no use to run them on Atari... thats TRUE Atari
>spirit.

I'm talking about real Atari's here, not clones or a mere 150 CT-60 powered
Falcons... taking that in account do you really advice someone with a normal
TT or Falcon to run that stuff? Did I say run? Sorry I ment crawl....

>All is better as runing Pine on Atari (since it dont run in magic) even
>buying pc, or Mac etc..

Irony doesn't suit you Janez....
Let's rephrase that sentence a little :"All is better as running Pine on
Atari (since it's OS-specific), buy a PC or Mac if you really want to use
it, otherwise use a Atari-specific program."
How about that? That's what I really ment... no need to twist words around.

>I find Airc great app, especialy VA_Start and stuff,but i dont use it. And
>i never called it crap, also Lonny knows i prefer ircII and ve NEVER had
>any grudge about it..

We finally found something we agree on.... :-)
I never said that Airc is crap either, it's not because Lonny doesn't think
much of my "contributions" that I automatically think the same of his. We
have an argument at the moment, but that doesn't have anything to do with
what he created and/or will develop in future.

>Yes, and that what i realy cant grasp... We mention that we can runs some
>extra stuff, and suddenly we are traitors, OS lack Atari spirit etc.. And
>no bad words of those who for SAME stuff bought PC or MAC, or sent Atari in
>closets or in bin and now use MagicMAC..

You can't grasp it because you still look at this subject with a blurred
vision... there are people who buy a PC or Mac and forget all about Atari,
they do come back from time to time here asking how to convert their old
games to a format which their new platforms understands. These people aren't
Atari users anymore. Then there are people who love working with Atari but
some of their favourite applications need power, power which their original
hardware lacks. If they happen to use a Falcon they could have tried to get
hold of a CT-60, and having to wait for it 2 years... If they happen to have
a TT, they don't even have a choice. There are no more clones for sale, sure
they could wait for the next clone to arrive, that one is almost three years
in the pipeline... waiting for stuff to appear is nice, if you don't need the
power today... so these people bought a PC or Mac and run their apps on an
emulator, an in the mean time they can use stuff from that other platform as

well, stuff which is not available on this platform. As a matter of fact I'm writing this post on a Mac running MagiCMac right now... so what? If this was a Mac newsgroup I could be flamed for using "alien" software, but since this isn't the case...
I've got a 060-clone gathering dust here ever since I bought the Mac. MagiCMac is almost 20X faster, and everything that runs under Atari-MagiC runs under Mac-MagiC also. So from where I am sitting, I moved forward... although the clone is gathering dust, the TT isn't, I use it almost every day for doing things that are not processor intensive. And yes, I enjoy working with the TT much more, but at a certain point one has to make a choice. Unlike many I didn't bought the Mac to move away from this platform, my only reason was to run MagiCMac and have a fast Atari, in the mean time I discovered some Mac apps which we haven't got, so from time to time I use Mac software, but only if there's no alternative. For Internet access I still use the IConnect-clients except for browsing, I browse with Opera now. There's absolutely no reason for me to start using a Mac mailer, news, ftp etc client, they aren't any better and don't really offer anything more either... and the same can be said for a lot of the Atari apps. If tomorrow someone announces a 060 or PowerPC upgrade for the TT, I'll be standing in front of the line to get my hands on one, but until then I'll use MagiCMac.

>All that is perfectly okay, but attempt to run those apps on our Ataris, is
>dreaming and so on.. But well, Lindbergh was called dreamer as well, same as
>Wright brothers..

You can port the apps and start them up, but there's no way you'll ever see them "run", at best they'll "crawl" on a Atari, clone or powered Falcon. And anyone stating different in my book is a dreamer... I've been reading the silliest claims here over the years and kept my trap shut just like all the others, now I don't keep it shut anymore... though! The best you can do is port some small utilities, drivers and apps that don't require power from the processor.If you think *that* stuff is going to save this platform....
Who are we kidding anyway? A 68060 is a lot faster then a 68030 but by today standards it's just as outdated.

>Also need to mention SSL. Without that, u cant use e-banking etc.. and MiNT
>offers SSL to be used with CAB, not only with some alien app. Other problem
>is that CAB has probs with some forms and dialogs, esp things introduced
>after CAB developing stoped, but SSL support to GEM is done via MiNT.

We gaven't got a browser on this platform that allows entrance, most of the sites that require SSL, require JavaScript as well... at the time that SSL was developed for MinTNet it was iilegal to export it out of the States.
The programmer of IConnect didn't want to break any laws, and that's probably the reason why all the other stacks haven't got SSL either but IMO this isn't an OS related matter...

BTW: I work in a bank.... and I've seen too many horror stories the last couple of years. I would **never ever** use e-banking. And no, I will not comment further on this issue.... work it out for yourself.

>BUT, again, i need to say that all stuff i do like in MiNT, all which in
>my eyes makes it "better" as Magic are BONUS in MiNT. Atari feeling is not
>risked. I know many ppl, with Mtos like setup only (just kernel + naes),
>just to take advantages of loadable devices, like ext2 drivers, since, lets
>be fair, ext2 partitons are fast and rock solid. Long names also aint
>problem on them etc..

Yes let's be fair: what's wrong with FAT32 partitions? these are fast and
rock solid also, and long names aren't a problem either... and they are
recognised by PC and Mac, which is great for compatibility reasons.

>Dont forget, such driver, let say some internet protocol, can be
>compiled on MiNT easily and its ready to use.. Dont fell on
>"antipropaganda" that all that is just talk and dreaming, and there is no
>scsi<>ethernet drivers etc... Those devices are NOT free, and driver
>sources are NOT available, same as hardware specs for devices, so they cant
>just be compiled...

Antipropaganda? You've just shown what I'm on about for the last two months.
Don't expect miracles... and if anyone promises them, call them dreamers. The
best we can hope for is a bunch of drivers, which will only be of use to a
very small minority. People that develop apps from scratch are obviously
not part of the MiNT-community, except for people improving the OS itself and
a bunch of guys porting over some more exotic drivers.... that's it.
If you wannna see a new word processor, spreadsheet, PDF reader, DTP, graphic
or even a DVD driver appear, then better put yout trust in the gang that caters
for the three major used OS's. Oh, but there's one small difference ofcourse,
these people want to be payed for their work... so the choice is easy realy,
you all put your money on the dreamers dreaming up dreams, or you all are
realistic for once and support the side that never comes in here, shouting
out loud and claiming silly things, which never appear....

>And again, those things are bonus and optional! U may use them or not, u
>may install full Easy MiNT or u may install just kernel + N.AES. The
>problem as i see it, is that MiNT, esp FreeMiNT and EasyMiNT are freeware,
>but N.AES is not. So atm, there is no distribution which would install AES
>as well. That means, that unfortunately, EasyMiNT installer installs MiNT
>and Unix envoriment, but not N.AES. so that must be done manualy... And
>dont hesitate to ask for help, we are NOT monsters, ppl wana show us as!

So why can't XaAES and Thing be put in a distribution? Someone who wants a
better setup can still opt to install N.AES and/or Jinnee later on... and
IMHO an installer should be able to install the whole lot, without people
having to ask help afterwards.... ever seen the GEMinstaller in action? How
difficult can it be to write a script for it that covers almost every possible
setup? hell I even done it....

>> You probably don't care anyway.
>
>Yes, thats another thing which imho is bad.. "I dont need that. so i dont
>care" attitude... that dont help scene a bit.. imho, its destructive....

There's nothing bad about it... I'm not even remotely interested in anything coming from the unix world. And from what I've written above it should be crystal clear that I don't believe in the fairy tale about that stuff helping the "scene" at all either. So yep, I DON'T CARE. And please stop with that "destructive" tale... that word is used here whenever it suits someone. The only thing that will get destroyed eventually is the enormous ego of the guy who ported that crap... Why would I or anyone else care for something that doesn't interest him?
E.g: I'm not interested at all in the scene that codes demo's, it's beyond me why on earth some people waste valuable time on coding that stuff, if tomorow someone codes the *ultimate* demo, fine...
But you won't hear me cheering, that demo won't help this platform one little step further at all, so IMO it'll be useless, a waste of time, not necessary, and I'll most likely will refer to it as "crap". But I really fail to see how this could be destructive? Someone who creates something, no matter what, be it a program, book, music or whatever, should be prepared to be critisized, and not all critic is constructive...
Now, supposing you would port a nfs driver.... fine, it's probably because you needed it, and if a few others can use it so much the better. But when you or someone else come in here cheering about it and telling us this is the way foreward for this platform, expect to find me on your path... that driver might be usefull for some people, but the patform itself won't move forward at all with or without that driver.
It's simple really, look at this and all the other platforms, and see what the most used applications are.. that's the stuff which needs to be spewed out, if you can port is and it runs at a reasonable speed, so much the better, if not then it'll need to be created from scratch. One thing this and related threads made painfully clear is that the majority here wants a better newsreader, and since the majority wants it, it'll need to be more then a CLI running in a GEM window... a GEM newsreader running on the three OS's and preferably with the three major used stacks (MiNTNet, STiK/STiNG and IConnect) is one of the things I call moving forward...

>So if someone makes app for calculating popcorn baking times so what..
>Better spen time and knowledge as the time spent for bashing him wht he did
>such useles crap...

Not at all.... he after all ****MADE**** it, he didn't port it. And that is something completely different. That popcorn baking time utility would also run on the three OS's. Unlike some people I never bash Atari software or Atari programmers, as long as they cater for the whole platform, everything is just fine by me... I don't bake popcorn so I don't need it, but it'll be an asset for the ever growing catalogue... ever looked at that ported stuff catalogue?

>>Oh, and btw, if pine was such crap, why does it even exist on windows?
>>Or even macosx!!!
>>Don't they have good mailer as well?
>>The entire must be mad.
>
>Good point....

The fact that something exists on a platform doesn't automatically means it's good... Have you ever see and used Word Perfect and MS Word for Atari? These two are crap also... The number of people using it in general is a good way to measure how popular an app is. Just take a look in the Mac and PC groups, and see the amazing number of people posting with Pine there for yourself. Still think it's a good point? I think it's a stupid to make point... Kobold, Papyrus, Phoenix database, GFA basic etc... are also available for the PC, existing on a different platform, doesn't say anything about the quality of the software...

>Also remeber, he is a master of selective quoting... i NEVER seen any
>quoting in his replys, showing that i actualy said good things bout Magic
>etc.. or other ppl that is..

Ofcourse you didn't see me quoting that, I'm not going to reply to something I agree on... I don't think that there is one person here that doesn't apply selective quoting. If we would all have to reply to posts in full, then we would be writing night and day... This and some other related threads, take enough of my time as it is. Applying selective quoting is not something which I've invented. We all do it....
You also only reply to bits and pieces of posts that suits you, so we've got another thing in common :-)

>He is one person agains many MiNTers here, yet word counting for crap,
>idiotic, etc, he would win easily....

I'm counting 4 or 5 MiNTers, if that number is "many" by your standards then this platform is in a much worser shape then I thought...
As for the word counting: just like you I'm not an English native speaker, I've learned traditional English at school, and picked up foul English in here. "Spewing bullshit" has the trademark from Lonny stamped all over it, "idiot, idiots, idiotic" carries the Frederic Fouchet trademark. etc. Let's say that I've stooped down to their own level and that they don't appreciate it... so yes, I'm winning on points :-)
In general you don't use foul language when addressing me, and neither do I, you'll only see me using it when someone dished a bowl out for me...

>P.S> Forgot this: even XAAES got its share of critics. Magic fans, MiNT
>haters, Dennis, instead of bitching, and moaning and cursing, try to
>contact XAAES authors, or mailing list and suggest changes, what ud like,
>what u dont like...

Janez, you really need to read my posts better.... I've repeatedly said here that XaAES is a *LOT* better then N.AES, I even gave examples of apps not or incorrectly running under N.AES, while being perfect under XaAES. So all that moaning, bitching and cursing comes from someone else.... it can't come from MagiC fans or MiNT haters either... so you'll better look in your own corner to blame a couple of persons.

>Same for Highwire, instead of ranting its bad offline browser, contact
>authors and try to make it better... That is one of good things with open
>projects.

You are number three on the list so far who would love to hear me make some comments on Highwire... so far, I can only say this about it: I have a much better offline browser here and since I can't go online with it (no Iconnect support), the actual version is rather useless for me... But I do disagree completely about "one of the good things with open projects", give me just *one* example of an open project that is now better then it's equivalent, be it shareware or commercial...
You guys want everything to become open projects the problem however is that hardly anyone is capable of bringing it to a good end... What happened to QED since it's an open project? What happened to Chagall? etc...

>Many "hardcore" atarians went MagicMAC because of power..
>Many Magic fans ordered Ct60 as well. Odd, since here we hear that only
>MiNT is slooooooooow.

Read the posts again.... almost all these statements were made by MiNT users, hell you even said it yourself...
MagiC is a little faster but it's not like we're talking factor 2X here, what I also remember from these posts it that the impression was given that MagiC is only usable on lowerend machines. Why would only MiNT benefit from running on a 68060? Remember MagiC-Milan? Also remember that the Milan came pre-installed with MiNT+N.AES+Thing? Ever thought why on earth some 50% of the users payed $200 extra for running a different OS? People recognise crap when they see it... The Milan was a MiNT machine.... it's dead, which only goes to show ;-)

Cheers from Belgium
Dennis

>Opinions are one thing, I don't care if they thinks stuff is crap, but at
>least take into account that others use this stuff on a regular basis.

Since when are you so a considerate person? All I'm doing is dishing soup out
of the same bowl some people here have used for years. Ain't it funny that once
you attack something one of these people like, all of a sudden its an enormous
issue... it used to be moaning and crying if it came from the other side, but
now its destructive and harming the platform...

>The constant negative feedback aimed at mint, mint groups, or whatever
>wording is getting really old. In fact it is Dennis who perpetuates the
>split.

"MagiC is a kiddie OS"
"MagiC is for people who have no needs"
"MagiC is only used by morons"
etc....
Remarks like these have been made here for years on end, well, the wind has
changed direction and the dirt is blown back.
You obviously don't like it..... tough!

>Telling him to drop the sig, and then letting him run a muck on his own
>is one solution though. Hope it solves the problem for you.

If you would have paid any attention at all, you would have noticed that I've
dropped the DDP signature a couple of days ago, without anyone having to ask
me to do so. It was very obvious to me that the anonymous moron who seems to
have a problem with Derryck, would use this issue to his advantage...

And he did...
The "foul" and "bad" language quoted, coincidence or not all come from posts
which don't carry the DDP signature. In that light your comments are worthless,
but then what's new ? ;-)

Cheers from Belgium
Dennis

Hi Frederic,

>>Because even the greatest MiNT die hard realised that Pine is ported crap,
>>and nothing beats a platform specific app?
>
>Pine a ported crap?

Yep :-)

>What emailer on atari (not ported) supports IMAP? (yes I use that)
>Please do some research before you claim something to be crap.

AFAIK none... supporting IMAP or not doesn't change one thing to the fact
that it's crap on *THIS* platform. And since there are hardly any Pine users
here I presume that IMAP is not an important issue for most of us...

>PINE is awesome because of IMAP, speed, low reqs (specially good on low
>end Atari), you can print, spellcheck, addressbook, check newsgroup mixed
>with email, easy interface, constantly developed/updated, multiplatform
>mailer, you can use any editor you want to type your messages, (wanna use
>Luna to type your email? no problem, set pine to use external editor),
>wanna view Attachement pictures (MIME) from PINE? define a viewer to start
>a GEM viewer etc.

Gee... you've just described my mailer, and it ain't called Pine. Oh you
forgot a couple of minor issues, like filtering, a database mode, drag &
drop, GEMScript client, perfect integration with other clients of the same
family etc.

>Besides, because it is text based (ncurses), i can check my email,
>newsgroups from anywhere (from work for example) as long as I can telnet,
>or ssh to my machine, like if I was at home.
>How do you do that on magic?
>You probably don't care anyway.

I don't need to.... I can check my mail anywhere in the world, all I need is
a computer and an internet connection. I can even check it on my cell phone,
I can check it on a web based server also. You're example would have been an
issue a couple of years ago, today however just like Telnet it's superseded.

>Oh, and btw, if pine was such crap, why does it even exist on windows?
>Or even macosx!!!
>Don't they have good mailer as well?
>The entire must be mad.

Since when it that a sign of quality? Take a peek in a Mac or PC newsgroup to see how may people post with Pine... for the record, I don't care about what runs and is available on other platforms. Pine on this platform is crap, and there are several good alternatives available...

>Do you know how cool it is to have papyrus, or calamus or whatever Atari
>GEM application running and in another window having some unix
>application?

I don't care if it's cool or not. For the same money you can open a real Atari application in that window, one which is even cooler... I always thought one ran apps out of necessity, but you run them because it's cool, that's a waste of time in my book :-)

>MiNT = what you've got + extra.
>(perfect combination if you ask me)
>
> Some people are getting pissed because:
>Magic = what you use to have - some extra that don't work anymore.
>(otherwise GEMDOS FATAL ERROR)

That's one view....
You still don't won't to understand that in principle I haven't got anything against extra's. If tomorrow someone codes something that uses MagiC or MiNT threads, that app will be OS-specific also. What I don't like is the plain ported stuff, regardless if it runs or not on more then one of the three OS's. I'm convinced that if more time and effort would be put in those ports, like for example a GUI, they would be more popular. Let's face it, those ports are hardly used by anyone, it's always the same small group of people that knows/uses them and is enthusiastic about them.... are all the others morons? I don't think so... so there must be another reason, this is 2003, we all have a mouse attached to our computer, its ment to be used...
Those extra's are not the future or a way foreward for this platform, the normal day to day apps are... and since these can't be ported because our hardware lacks the power to run them, the solution is simple if you ask me, stop wasting energy in those extra's and put that energy towards developing some real Atari goodies, preferably goodies that run on the three OS's...

Cheers from Belgium
Dennis

>Nearly all those are aimed at me. I don't read all his posts, I pick
>what I want to respond to and ignore other ones, much like he bobbles
>aroundon topics.

>Needless to say, the foul language is a sign of weakness.

R.Spanger, Thruth and Brother Blessed who are in fact one and the same
person, sorry I ment moron... took the time to search up all the foul
language I've used lately.
If foul language is a sign of weakness, welcome to the club Lonny:-)
I won't quote all the slip ups you've made, but if I get a dollar for
everytime you used the word "BS" .....

>They think they can run people out of here, well it won't work with me.
>Certain people here need to adjust their attitude, learn to skip posts or
>get a mailer than can automate post skipping. I am not going anywhere.
>If I'm so full of "it" then why the harsh replies, go figure... ;-)

The anonymous moron made it easy for you and everyone to see... he gave
the date and/or thread where those "harch" replies were made, check them
out, and see to what kind of "posts" I reply "harch"....
You've started it, so don't come crying here.... END IT, and I'll do just
the same, keep it up, and you ain't seen nothing yet. And yep, I know I
should be sensible and let it go... but I won't, you've gone too far.

Cheers from Belgium
Dennis

5896. Atari, etc., Swap and Sale September

Newsgroup: comp.sys.atari.st
Date: 2003-08-24 17:56:40 UTC
From: "R. Wayne Arenz" <atari6502@yahoo.com>
Message-ID: <s%62b.80781$hc.33733@fe3.columbus.rr.com>
Source record: 24274

The Atari Computer Enthusiasts of Columbus, Ohio, wish to announce their 2003 swap and sale. Date: Saturday, September 13. Place: the same as it has been (mapquest to: 980 Lenore St., Columbus, Ohio -- Oakland Park Community Center. A bmp scan of the map is available if you have a fast connection or can deal with zip). Time: same as it has been (9 am to 3 pm, EDT). Price: same as it has been ($6 for a table which includes admission for one, $4 for single admission, maximum of $8 for family admission).

What to buy/sell: Though generally anything Atari and Atari-related, we're absolutely tolerant of other game systems, computers, electronics, software, etc. The CCAG gaming show in Cleveland was canceled for 2003 ... you folks are all welcome!

This year ACEC will NOT be doing a massive mailing campaign due to cost. I will be mailing to the 30-odd who indicated they have wished snail mail. Therefore, please help us get the word out: post everywhere of which you know, e-mail your friends, etc. Also, if you wish, let me know of physical and e-mailing addresses for almost-certain attendees. In a similar vein, let me know if you want OFF these mailing lists.

See ACEC's web page at:

http://www.angelfire.com/oh4/acec/acec.html

Look at the photos, there are your answers.
http://www.thermaltake.com
It's easy to found distributors of the Aquarius II kit (with google).
You need another 68060 because it's impossible normally to remove the
radiator of rodolphe without destroy the 68060 !!!
My cy2291 cloked by 20MHz send the 69.7MHz on the CT60, I use this
frequency because my 68060 not works at 72 MHz !
So it's not easy to found a oscillator with a frequency between 66 and
72 Mhz.
There are just some 68060-60 MHz who works at 72 MHz, I know for example
the coder XI. I not remember his website, but you can found a link on
the CT60 forum http://www.dhs.nu. This 68060 works with a normal fan !!!
The limit of my 68060 is just 66MHz, so I have tried to bypass this
limit because at 69.7MHz my 68060 crashes a 30 degrees celcius.

Regards,

Didier.

Depends on it's colour. If yellowish, it may well be like Evostik;
if black, it might be Bostik, which I have always found very good
for sticking rubber to metal or soles to shoes (there is also a
clear version, but IME this does not form as good a bond). Again a
contact adhesive - spread thinly on both parts, wait till nearly
dry, then bring together. If you do it while wet, it might take
ages to dry out the solvent, and the parts may slip relative to
each other; while the suggested oven curing method might help,
judging by the smell the solvent is something like benzene, so it
may not be 100% safe to do this!

I agree, Joakim. When will people realize that the worth or value
of something is what a buyer is willing to pay?

The only problem of setting a price that seems high is that after
a while people reading the bids/messages may think that it
represents the norm, and this forces prices up.

Excuse the shouting :-)
---UNSNIP---

>Hopefully, when you get that gfx card you can bump it up to 80 columns. ;-)
>Seriously though, any particular reason for narrow columns?

I'd much rather see such narrow columns than over-wide ones, as
produced occasionally by others in this group. In my newsreader,
at least (CixRead), These are *very* difficult to read as it does
not wrap lines properly - the last character at extreme right is
lost and the (usually short) rest of the line appears as a line on
its own, followed by the next message line. Although this is a
reader provblem, ISTR that RFCs specify lines not exceeding 70-odd
characters, and it would be helpful if everyone kept to this. One
of the problems is that the ASH Emailer (I think) doesn't respect
the set width.

While on reading difficulties, Janez I wish you wouldn't use 'u'
for 'you' - it brings me up short and breaks my line of thought
each time I read it. 'Ppl' for 'people' isn't so bad, as it
doesn't occur as often. But I feel such abbreviations, while
useful for phone texting, are out of place in news groups or
email. What do others feel?

Again, again and again u showed yourself as MASTER of twisting and turning the facts as u like... WHERE did i say developers MUST develop apps only for MiNT. I said like 100 times, that if application is developed in accordance to GEM guidelines, it will work in MiNT, Magic and TOS... Even in post u replied, i mentioned that guys developing MiNT are OS developers, and to blame them is as stupid as to blame Andreas Kromke why there is no new Word proccesors and other apps. U again in your manner overlooked quite big chunk of my message, and answer only parts u can make harmfull. Again: MiNT developers develop MiNT, they work hard and they work on it to be ATARI os and stay compatible.. Thus all GEM apps, new ones like Porthos etc work without ANY troubles, if we forgot on Magic AES problem... And this clearly show, that MiNT developers CARE bout Atari and feeling, and there is not a single directive, to guide coders how to code for MiNT. Since to code for MiNT is totaly equal as coding for Atari... Any language we have produce working apps, FaceVAlue (builds generic GEM code from RSC files) apps work like poem. Even more, in MiNT docs, proper GEM coding is encouraged, and MiNT specific calls are well documented.... Now, u name me one application (not port) specificaly developed for MiNT? Its fair to exclude setup apps, like MiNTSetter etc, since those are a mustbe OS specific, same as Magic INF file editor...

> So yes, I refer to OS-specific apps which on top of that come with no GUI

Only have one question for you: IS magic a CRAP? Did i EVER call Magic a crap, or let say Iconnect and Iconnect related apps since they are bonded to one OS? I didnt. WE didnt... I have no use of those apps, they ARE OS specific but i still wont call them a crap.. Many arent bad apps at all, just wrongly designed....

>>Dennis on other hand, use word lame, lamers, crap a LOT.

> powered Falcons... taking that in account do you really advice someone
> with a normal TT or Falcon to run that stuff? Did I say run? Sorry I ment
> crawl....

Dennis u have no idea what u talking about. As i explained in my message, and u again seems to "overlook" it, i used TT with 4/4 mb ram as my server to cable modem from 1997/8. I used it as cable modem server via riebl VME ethernet card and as ip masquarading machine, since my main machine, Falcon, was pliped to TT. PLIP in MiNT is proper LAN, and since TT acted as ip masking, i accesed inet directly, speeds up to 150kb/s. Since ethernet drivers, ip masking, mintnet are daemons, they dont crawl, but they hardly aree noticed... Same for "crappy" non GUI apps, which do not spend 90% of cpu power to draw nice icons... runs decently, read that fast... Above that i ran n.aes but lack of ram kicked in, so i didnt run much things.. And ill say again, i am proud on all Atari lan and cable inet connection... Beat any Atari user, who would ditch TT to closet and use a PC as server....

>>All is better as runing Pine on Atari (since it dont run in magic) even
>>buying pc, or Mac etc..
>

> How about that? That's what I really ment... no need to twist words
> around.

No one twist them, now how can Pine be OS specific? From SAME sources it run on MiNT, Linux, Irix, Macos, BeOS, Windows, and some 10 other OSes. And no, i wont buy PC or Mac, if i can make a task on Atari. U prolly also watch jpegs on Atari, or GIFs, u dont just watch PI* or NEO pics and use a PC for alien formats.... The money saved ill rather spend for buying and suporting remaining Atari developers (which make apps according to GEM standards, so they run on any OS)

> We finally found something we agree on.... :-)

> this platform. As a matter of fact I'm
> writing this post on a Mac running MagiCMac right now... so what?

:))) Your nick should be Twister.... I knoiw u use MagicMAC and did i EVER
use that against you. But u have the balls to use alien hardware, on that
hardware use alien OS/apps BUT spit and insult everyone else who just use
some alien apps (AGAIN: as bonus feature) in order not to leave Ataris in
closets! That is the wrong part, not u or anyone using Mac or PC. But u use
Mac, love Magic (all okay with that), which wasnt updated in years, spit
and insult everyone, no matter if thats MiNT OS developer (who actualy
support Atari a lot) or me, since i dare to used alien apps, to have cable
working on my Ataris, or since i ran pine or ircii (altough i did say i
then stated to use Amail) or anyone else not fitting in your scheme. Thats
pure hatery. U just cant say, or type, that MiNt is a good and definately
an ATARI os, that its developers makes great job, u rather left all such
parts from replys and use parts in which u only can spit on ported apps...

> I've got a 060-clone gathering dust here ever since I bought the Mac.
> MagiCMac is almost 20X faster, and everything that runs under Atari-MagiC

> be said for a lot of the Atari apps. If tomorrow someone announces a 060
> or PowerPC upgrade for the TT, I'll be standing in front of the line to
> get my hands on one, but until then I'll use MagiCMac.

Use it as u wish... But remember, in my eyes your Atari spirit does not
grow up, since u use Mac and have Ataris in closets... Its totaly your call

> You can port the apps and start them up, but there's no way you'll ever
> see them "run", at best they'll "crawl" on a Atari, clone or powered
> Falcon. And anyone stating different in my book is a dreamer...

Well I am a dreamer then... We talk bout ports here, and there is one
fact u dont know: CLI ports run preety fast, even on plain machine. Even
those with NCURSES GUI. Even more, running them makes a lot less stress on
CPU as GEM/GUI apps. That dont apply to all apps, but Pine, ircii, lynx,
ncftp... runs, not crawl, happy. So i am stating that, and u run some 1st,
then make judgements.... X apps are the one which are harder to run....

> reading the silliest claims here over the years and kept my trap shut just
> like all the others, now I don't keep it shut anymore... though! The best
> you can do is port some small utilities, drivers and apps that don't
> require power from the processor.If you think *that* stuff is going to
> save this platform.... Who are we kidding anyway? A 68060 is a lot faster
> then a 68030 but by today standards it's just as outdated.

Again, u do TWIST my words again: I did say that MiNT is not something u
want to show (in wrong sense) instant saver of Atari as platform. What im
saying, and ill again repeat is this: MiNT with GCC and ability to compile
unix sources (OS independant) allowed ppl to use ethernet and cable modems
years ago. And since MiNT is native Atari OS, that means all GEM/Native
apps can benefit from that. If your ISP cancel dialin and go cable/adsl
only, MiNT can adopt fast. that is done already, but if some of inet
services change specs, maybe to ipv6 or something like that, MiNT will
provide drivers fast, on OS level, transparent to apps. That is not joking
anyone, those are facts (i gave me as an example with my TT). Other example
are unixfs drivers, fat32, amigaFS drivers etc.. Its not important that
virtualy noone can benefit from AmigaFS, important is that its easy to add
such stuff, and that its done on OS level and transparent to apps.

> We gaven't got a browser on this platform that allows entrance, most of
> the sites that require SSL, require JavaScript as well...

I did say that as well, but to adopt to my stuff above: it was done, it is
working and its transparent to CAB. Thats important imho. If u can adopt to

XXX new protocol quicky and on OS level, u dont need to adapt applications,
and in days of lacking developers, thats important....

> at the time that SSL
> was developed for MinTNet it was iilegal to export it out of the States.
> The programmer of IConnect didn't want to break any laws, and that's
> probably the reason why all the other stacks haven't got SSL either but
> IMO this isn't an OS related matter...

Please... So now are US laws quilty that no SSL? As u say "probably",
since u have no clue...

> BTW: I work in a bank.... and I've seen too many horror stories the last
> couple of years. I would **never ever** use e-banking. And no, I will not
> comment further on this issue.... work it out for yourself.

I will, u dont use/need it.. so coder is an idiot to make it... And do i
really need to tell ALL. Its not just ebanking, its also ordering things
via browser etc etc.. i did order few things sucessfully via inet and credt
card....

> Yes let's be fair: what's wrong with FAT32 partitions? these are fast and
> rock solid also, and long names aren't a problem either... and they are
> recognised by PC and Mac, which is great for compatibility reasons.

Yes let's be fair: what' wrong with ext2fs partitons? Or Minixfs
partitons? Or FAT32? Nothing. MiNT has them all. And Inode based ones are
more reliable as FAT table ones...

>>Dont forget, such driver, let say some internet protocol, can be
>>compiled on MiNT easily and its ready to use.. Dont fell on

> be of use to a *very small minority*. People that develop apps from
> scratch are obviously not part of the MiNT-community, except for people
> improving the OS itself and a bunch of guys porting over some more exotic
> drivers.... that's it.

You are soo right! Problem is that i claim EXACTLY the same for quite some
time u just twisted it every time. There is no Magic/MiNT coders (apart
from actual OS developers) but just coders... I said in previous post
(imagine, u overlooked it) that GGT2 i did run on both OSes and TOS and i
didnt spent a second thinking bout that. Same for any coder... They only
need to think bout OSes when inplementing either ifussion or mintnet stacks
and such things.. And most of them do that in forms of OVLs novadays...

The other bunch of guys port apps and drivers... Whats wrong with that? they dont port each and every app, but those they may find usefull. Im surely gratefull they ported NFS, and riebl drivers, inet sockets

> If you wannna see a new word processor, spreadsheet, PDF reader, DTP,
> graphic or even a DVD driver appear, then better put yout trust in the
> gang that caters for the three major used OS's. Oh, but there's one small
> difference ofcourse, these people want to be payed for their work... so
> the choice is easy realy, you all put your money on the dreamers dreaming
> up dreams, or you all are realistic for once and support the side that
> never comes in here, shouting out loud and claiming silly things, which
> never appear....

Dennis, WHY are u doing this, i know u are not SO stupid. Thats EXACTLY what im babbling here for quite some time and u ignoore... And now repeat that as own invention. Those coders code ATARI apps. And those apps work on any ATARI OS, sometimes TOS is excluded. They work on ANY OS because OS developers made their OSes compatible... Im telling that for long here.. Those coders do not develop MiNT ot Magic apps, just GEM apps. Money has no issue here, i did and do pay for apps i use. I also want to reward coders for hard work... And if there is app i dont like/use/need i STILL test it and usualy send friendly message, i dont call them lamers if they happen to used Magic AES methods...

And when ull found one item i shouted about and it didnt appear, let me know...

> So why can't XaAES and Thing be put in a distribution? Someone who wants a
> better setup can still opt to install N.AES and/or Jinnee later on... and
> IMHO an installer should be able to install the whole lot, without people
> having to ask help afterwards.... ever seen the GEMinstaller in action?
> How difficult can it be to write a script for it that covers almost every
> possible setup? hell I even done it....

Well this part is easy. XaAES is now part of official FreeMiNT CVS tree, but its not good enough yet. Thing is NOT Free, so can't be added as well.

> There's nothing bad about it... I'm not even remotely interested in
> anything coming from the unix world. And from what I've written above it
> should be crystal clear that I don't believe in the fairy tale about that
> stuff helping

What u believe or not is not neccesary to the right thing... U arent remotely interested in stuff came from Unix world... Okay, so u dont use Anodyne CD writer software, Aniplayers jpg/mpg etc decoders.. and so on..

> the "scene" at all either. So yep, I DON'T CARE. And please stop with
> that "destructive" tale... that word is used here whenever it suits
> someone. The only thing that will get destroyed eventually is the enormous
> ego of the guy who ported that crap... Why would I or anyone else care for
> something that doesn't interest him?

Thats all tale for you... U think its tale. But i AM offended by many of your bashings, i repeat bashings, not criticism in proper way. Result is,

that i stopped seeking for problem someone reported for GGT2 on Magic. And that purely cause of your mouth... But ah, u dont care bout that or the GGT2, it wont run on Mac anyway, so i guess i "can crawl in pit i crawled out...."

> E.g: I'm not interested at all in the scene that codes demo's, it's beyond
> me why on earth some people waste valuable time on coding that stuff, if
> tomorow someone codes the *ultimate* demo, fine...
> But you won't hear me cheering, that demo won't help this platform one

> fail to see how this could be destructive? Someone who creates something,
> no matter what, be it a program, book, music or whatever, should be
> prepared to be critisized, and not all critic is constructive...

There are serious apps, which directly came from demo coders or their techiques. U dont need to cheer demos if u dont use them, but since u dont exactly create anything, dont call them crap, since many demos are coding wonders, and coders lamers etc....

> Now, supposing you would port a nfs driver.... fine, it's probably because
> you needed it, and if a few others can use it so much the better. But when
> you or someone else come in here cheering about it and telling us this is
> the way foreward for this platform, expect to find me on your path... that

> forward at all with or without that driver.

Thats your view... But if that driver prevent ONE person to migrate from Atari, the job is done and benefit was done as well. If I will say NFS driver is Atari saviour etc bla bla, u can disagree, but if ill say its nice that i can use NFS WITH GEM apps, then dont bitch and call me lamer and so on. There is HUGE difference...

> It's simple really, look at this and all the other platforms, and see what
> the most used applications are.. that's the stuff which needs to be spewed

> then a CLI running in a GEM window... a GEM newsreader running on the
> three OS's and preferably with the three major used stacks (MiNTNet,
> STiK/STiNG and IConnect) is one of the things I call moving forward...

I agree. But dont bitch MiNT developers if such app dont appear. It only takes that one write GEM newsreader, Stik compatible. Both OSes will be happy. But u NEVER bitch on Magic developers (and we know Kromke cant help there) but only on MiNT developers (what Frank, Draco etc) has to do with that?

> Not at all.... he after all ****MADE**** it, he didn't port it. And that
> is something completely different. That popcorn baking time utility would
> also run on the three OS's. Unlike some people I never bash Atari software

> or Atari programmers, as long as they cater for the whole platform,
> everything
> is just fine by me... I don't bake popcorn so I don't need it, but it'll
> be an asset for the ever growing catalogue... ever looked at that ported
> stuff catalogue?

Well u want to twist (o suprise) my post. U know VERY well that i on few ocasions wanted u to differ MiNT developers (guys working on MiNT) and those who port. Your saying, that u never bashed Atari programmers is just not true... U know, i know that. But even if people port software, thats not reason to bash and insult. As i already said, if a port prevents one user (i can speak that for myself, it did prevent me) from ditching Atari and went to other platform, it helped the comunity. Again speaking for myself, i did bought certain Atari internet programm, since i was able to use cable....

> The fact that something exists on a platform doesn't automatically means
> it's good... Have you ever see and used Word Perfect and MS Word for

> two are crap also... The number of people using it in general is a good
> way to measure how popular an app is. Just take a look in the Mac and PC
> groups, and see the amazing number of people posting with Pine there for
> yourself.

:)) Well take a look in some Unix groups and count Pine users there. Then for a comparision, count Outlook or Claris users there.... And then u will see that many users actualy do use Pine.. Ofcourse, they are prolly morons, but still, quite a lot of them....

> Still think it's a good point? I think it's a stupid to make
> point... Kobold, Papyrus, Phoenix database, GFA basic etc... are also
> available for the PC, existing on a different platform, doesn't say
> anything about the quality of the software...

Yes i do, as said above: dont expect many unix apps users in PC/Mac groups and vice versa. If application is used a lot, and Pine is (u need to know we can run other CLI mailers, not stucked with Pine) there is a development going. And Pine is developed... Claris/Outlook are apps, which in most cases adopt the Pine/Unix featires, like IMAP etc, if they have them

> Ofcourse you didn't see me quoting that, I'm not going to reply to

> quoting is not something which I've invented. We all do it....
> You also only reply to bits and pieces of posts that suits you, so we've
> got another thing in common :-)

Well u do reply and use own old arguments, which dont take in consideration stuff u didnt quote, and u claim u agree on them? If thats true, start distinguish MiNT developers from porters, and stop distunguish

betwen Magic/MiNT/TOS coders, or platforms... We said and u know that any proper GEM app run on them.....

> Janez, you really need to read my posts better.... I've repeatedly said
> here that XaAES is a *LOT* better then N.AES, I even gave examples of apps
> not or incorrectly running under N.AES, while being perfect under XaAES.
> So all that moaning, bitching and cursing comes from someone else.... it
> can't come from MagiC fans or MiNT haters either... so you'll better look
> in your own corner to blame a couple of persons.

Bitching does NOT come from Magic fans, it comes from You and Steve, respectively, some hard words as well. I do read your posts, and u shoud do mine as well: if n.aes have troubles, more as XaAES then something is wrong. We all actively folow XaAES, coders of it have N.AES and we all know N.AES is still a lot better. I did say that, we keep saying that N.AES is very stable, u dont reckognize that. I cant help if u think im either lying or hyping N.AES....

> You are number three on the list so far who would love to hear me make
> some comments on Highwire... so far, I can only say this about it: I have
> a much better offline browser here and since I can't go online with it (no
> Iconnect support), the actual version is rather useless for me... But I do
> disagree completely about "one of the good things with open projects",
> give me just *one* example of an open project that is now better then it's
> equivalent, be it shareware or commercial...

I dont want to hear comments. I want u to recognize a chance to sent comments and suggestions (not bitching) to HW developers. Instead of monaing about no Iconnect support, be usefull, talk with them. If Iconnect is NOT open to others, then rather blame Iconnect authors. U may ask them if they can make them open. Or u may use iffusion, and it will be ok, since Highwire is Stik compatible... Or its really easier to declare it usefull and crap?

Again u twisted: i dont mean open projects are necessary better (i know some in non atari domain|) but being open is also a chance u contribute, and get authors to make it better for u: try to get them iconnect stack specs, or suggest tabbed browsing etc...

> You guys want everything to become open projects the problem however is
> that hardly anyone is capable of bringing it to a good end... What
> happened to QED since it's an open project? What happened to Chagall?
> etc...

We guys? HW is not open since WE (who is we?) wanted to be open. It happened its open. And it staring to look good. I dont care if new product is open or not, only what im care is is there someone work something. I bought and still will my share of apps. And i keep sending bug reports or suggestions. Better as bitching. And opposite way is: u seems to dislike any open stuff, u are covinced that ppl who charge are better coders...

> Read the posts again.... almost all these statements were made by MiNT
> users, hell you even said it yourself...

> MagiC is a little faster but it's not like we're talking factor 2X here,
> what I also remember from these posts it that the impression was given
> that MagiC is only usable on lowerend machines. Why would only MiNT
> benefit from running on a 68060? Remember MagiC-Milan? Also remember that
> the Milan came pre-installed with MiNT+N.AES+Thing? Ever thought why on
> earth some 50% of the users payed $200 extra for running a different OS?

No, i said Magic is a GEM (as diamond, good stuff) on low end machines.
Regardiong 060: magic needs to be patched so it can work on 060, but it
dont use 060 specific commands. MiNT can be compiled to use them, that is
an advantage. Ofcourse ppl payed usd200, they like OS, they are used to it,
i would do the same, if Milan would come with Magoc...

> People recognise crap when they see it... The Milan was a MiNT machine....
> it's dead, which only goes to show ;-)

Uh Dennis, how come it be dead, if 50% of milan users went to Magic?
Atleast 50% of Milan could be undead then... But this statement is exactly
what i meant by your spice... So MiNT killed Milan, okay. I give up, u dont
need to reply, i just refuse to talk on this level and answer such
stupidty. u may declare u won or whatewer u want, im off with you.. Enjoy
your Mac, call Atari users loosers and live happy....

I'm a registered PhotoTip user. However it's gone unused for quite sometime now. So who is really spreading false information? You are the one that is beating down many things you have never tried. If you wish to be remember as the most narrow minded individual here, just keep it up.

I did not say anything to keep people from using PhotoTip, I stated the binary size, fact. I stated it's main purpose, I stated it had extra options, which other apps do better if you happen to already have other such apps. I stated it was a fine app. You can twist it into something else if you like, or perhaps you should seek some sort of English translation refresher course.

Ok, we are getting somewhere now. You are stuck because you can't run MiNT under magicmac. But again that is the path you took, yet you project your frustration on others who can do more.

>> I've got a 060-clone gathering dust here ever since I bought the Mac.

Why not dust off the clone and sell it to someone who wishes to remain
true to the platform, someone who doesn't want to use a mere emulator.
Take the money and get a faster mac.

> Use it as u wish... But remember, in my eyes your Atari spirit does not

>> Falcon. And anyone stating different in my book is a dreamer...

These things do not crawl on clones. You have become so hook on the
magicmac speed there's no turning back now. See, I never questioned
your equipment before either, look through your so called massive msg
archive. I question it now, I don't take emulator users serious.
All your comments about speed just went out the window. There's no
reference point to compare speed, as magicmac isn't really qualified as an
Atari. It's merely a 68k emulator, which has a poor design as well, since
it forces an OS apon you that you cannot swap out.

I have magicmac for both os9 full version, osx demo. I also have a
mac of course, fairly new one I might add. However, I will not and I
do not use magicmac for anything but looking at HYP files. I have found
it's handy for that when I run across one on the web. Outside of that
it's of no use to me. I am not interested in becoming an emulator user.

>> Still think it's a good point? I think it's a stupid to make
>> point... Kobold, Papyrus, Phoenix database, GFA basic etc... are also
>> available for the PC, existing on a different platform, doesn't say
>> anything about the quality of the software...

GFA-Basic is effectively dead on the PC. Case anyone wonders. ;-)

>> People recognise crap when they see it... The Milan was a MiNT machine....
>> it's dead, which only goes to show ;-)

Both the Milan and Hades have magic versions available, that is a remark
from someone who uses a mac exclusively. Now that I know you are simply
a mac user, I care even less what you say. So mint and mint ports don't
meet your emulators requirements. To bad for you.

So what's your real grip with me, now that I know you are a mac user,
are you upset that aIRC don't run under your emulator?

Let me also say even though I don't find anything Steeve says of much value, since his posts tend to contain foul language, he is however a genuine Atari user, unlike Dennis and his emulator.

Cheers to you Steeve, nice pic on the myatari site!

you totally do have somethin against extras.

Get OVER IT.
With MiNT you can run all your fancy MOUSE/16bit color icons GUI GEM
application. PLUS if you felt like it, run other EXTRA programs,
applications that do not exist on atari. (did I mention for free as well?)

> threads, that app will be OS-specific also. What I don't like is the plain

> morons? I don't think so... so there must be another reason, this is 2003, we
> all have a mouse attached to our computer, its ment to be used...

Are you retarded or stupid?
I am confused now, the mouse is a vital part of MiNT, like it or not.
MiNT users, guess what, run an AES as WELL! :)
The only people that would have to disable the GUI to do anything
productive would be the ones with stf with 1 meg of memory.

Dennis babbled:

>> Those extra's are not the future or a way foreward for this platform, the
>> normal day to day apps are... and since these can't be ported because our
>> hardware lacks the power to run them, the solution is simple if you ask me,
>> stop wasting energy in those extra's and put that energy towards developing
>> some real Atari goodies, preferably goodies that run on the three OS's...

And at the same time you post that from your magicmac setup. You have a clone in the closet that you think is to slow to use. Actions speak louder than words, you are saying one thing and doing another. If all the real machines are as slow as you state, there won't be anymore gem apps. Why code a bunch of slow sluggish gem apps? You are not making any sense the longer this goes on. You just keep digging a deeper hole.

There basically is no Atari market, it's pretty much all users doing their own thing. It's going to gravitate to open source and ports, and until you fully come to grips with that you are going to sound like a nut case. Thanks to you, since you wouldn't just drop it, we all now know the status of magic, and it's more or less not going anywhere. When you classify stuff as crap you are doing far more damage than I ever will. Just stating stuff is crap is destructive. Why not just say you prefer not to use this or that. It goes over a lot better and doesn't create and bad feelings. A lot of people have tried to explain the subtleness of opinions, but you seem to prefer making it more personal in nature.

The flipside of this is that someone so hopefully narrow minded such as yourself won't ever realize the error in their ways.

Anyone reading this stuff can see the obvious, you have one side that just deems everything of no interest as crap. The the other side simply tries to educate and correct the inaccurate comments, especially since they are coming from people who don't even use the stuff at all.

There is an OIDS-X for MacOS X. In that case you do not need any emulator at all.

Hello everyone,

I just got my hands on an old 1040stf, and i was wondering if i could use it as a midi sequencer. Therefore, i have the following questions:

*Do you need an atari mouse or will any serial mouse do the job?

*I found little information about the HDD connector. What interface type is it? I have an SCSI and a LPT zipdrive, any possibility to use any of them?

*As i'm interested in using it as a sequencer, how many midi channels does it have?

*Where can i get a copy of cubase for atari?

THanks for your help,

Philippe

>
> What i'm not sure about is the power connector on the Falcon
> motherboard. Is it used at all, or is the Falcon motherboard now
> powered through the connector on the CT060?

It is not used at all. MB is powered by a cable that originally coumes out of it to floppy, now it is connected to CT60.

You can't put serial mouses directly in the Atari mouse port, but you can use serial mouses with the serial port of the Atari (if it doesn't fit, even most PC shops will have converters) and you need a driver like Genmouse (free software). Works fantastic. There are also third party Atari/Amiga mouses which will fit in the Atari mouse port.

> *I found little information about the HDD connector. What interface type
> is it? I have an SCSI and a LPT zipdrive, any possibility to use any of
> them?

It's an ACSI connector, you can use it with an original Megafile and ACSI cable or buy a SCSI converter like ICD The Link 2: http://www.icd.com/atari/ But you don't really need a harddisk, you can work from a 0.7 MB DD diskette (yes, they still make and sell them). Harddisks work faster with loading and saving though.

> *As i'm interested in using it as a sequencer, how many midi channels
> does it have?
Standard 16 channels (and nearly unlimited tracks) with Cubase. If you use extra midi hardware, like the Midex, you can have 64 channels (4x16)

> *Where can i get a copy of cubase for atari?
Cubase Lite is free now, though very limited. Some Atari dealers stell sell Cubase (Peter Denk in Germany) and watch Ebay.

I have Atari mice in stock.
>
> *I found little information about the HDD connector. What interface type

Atari ACSI, you can use a Megafile or a SCSI with a Link 2 or Link 97.

All in stock.

I have an SCSI and a LPT zipdrive, any possibility to use any of
> them?

The SCSI Zip with difficulty, forget the parallel.
>
> *As i'm interested in using it as a sequencer, how many midi channels
> does it have?

16 channels from the Atari port, there are add ons like the Midex, Unitor
or SMP boxes to give up to 80 tracks over the 16 channels.

All in stock.

> *Where can i get a copy of cubase for atari?

Surprise, surprise, genuine Cubase v3 in stock.

Barrie at Keychange. www.keychange.co.uk

Do you've in the root of your boot disk a dir called "stik_cfg"?
In this dir there should be a file called default.cfg. The line beneath is
the only entry that must be set in that file:
ALLOCMEM = 300000

Adjust the value to your need.

HTH,
Martin

I suspect it is a clash between the router/network set-up and the
dial-up settings.

Is it possible to have both working at once without having to
reconfigure ?

Hi lp,

> Actually that was Steeve who started that, not Dennis.

Okay, But Dennis realy feel to correct us the all time and didnt correct Steve's claims either....

>>> I've got a 060-clone gathering dust here ever since I bought the Mac.
>>> MagiCMac is almost 20X faster, and everything that runs under
>>> Atari-MagiC runs under Mac-MagiC also. So from where I am sitting, I
>>> moved forward... although the clone is gathering dust, the TT isn't, I
>>> use it almost every day for doing things that are not processor
>>> intensive. And yes, I enjoy working with the TT much more, but at a
>>> certain point one has to make a choice. Unlike many I didn't bought the
>>> Mac to move away from this platform, my only reason was to run MagiCMac
>>> and have a fast Atari, in the mean time I discovered some Mac apps which
>>> we haven't got, so from time to time I use Mac software, but only if
>>> there's no alternative. For Internet access I still use the IConnect-
>>> clients except for browsing, I browse with Opera now.

And Iconnect on MagicMAC uses underlying MACs inet stack and daemons. So Dennis actualy say that using MagicMAC and use MAC OS resources is good, he even even feel proud, but adopting any of such resources or drivers to Atari is bad and killing the scene... There is just something wrong with that claim... And whats wrong is MiNT hatery: if Magic is run on MAC is good, if Magic use and rely on FOREIGN OS is good, if Magic also use FOREIGN OS resources and drivers is also good, but to use ONLY small parts (drivers) of FOREIGN resources on NATIVE OS is BAD! As long OS is called MiNT and not Magic.. Thats whole point.. I dont see other in Mac/Magic user blame MiNT and developers.....

>>> be said for a lot of the Atari apps. If tomorrow someone announces a
>>> 060 or PowerPC upgrade for the TT, I'll be standing in front of the line
>>> to get my hands on one, but until then I'll use MagiCMac.

And i dont believe that. 060 clone gathering dust since Mac is faster? I dont see how much quicker if at all TT will be ,so it wont beat Mac in speed....

> I have magicmac for both os9 full version, osx demo. I also have a
> mac of course, fairly new one I might add. However, I will not and I
> do not use magicmac for anything but looking at HYP files. I have found
> it's handy for that when I run across one on the web. Outside of that
> it's of no use to me. I am not interested in becoming an emulator user.

I have 2 Mac's none latest spec. I use then with Mac apps and also enjoy some games. Have MagicMAC on laptop, but i dont use it at all. For me point

of using Mac are Mac aps and os. I have 35+ machines and only on PC i have installed "foreign" OS. All other are used with native software. Needless to say, that MagicMAC, or other "loosy" emulators, only are GEM compatible. Atari feeling is soo much more as GEM only, its non GEM apps, games, trackers, tos apps, there is a lot! And all that spirit is efectively killed by MagicMAC (not Magic, if anyone will feel urge to mix that!!)

And i im perfectly aware, that all that cant be preserved, im aware that GEM apps etc benefit most from fast machines. But i just wont accept babbling about killing Atari spirit from MagicMAC/PC etc users.. I know many MagicMAC users, clone users.. and VERY VERY litle of then actualy babble about killing the spirit with MiNT or with fact we use Ataris still.

I object to these last insult with the most overwhelming weight, the MagiC
operating
system is a fine example of Germans programming, and the Mormon religion has
nothing to do with computer operating systems

> blame MiNT and developers.....

He makes no sense whatsoever. He uses his TT for non-intensive stuff
yet has a clone unused collecting dust. Main machine is magicmac,
one thing is magic already is non-standard, then to use it on a
mac emulator, then use that to judge what the rest of us do.
On top of that, comments about all machines and clones being to slow
to use. One can only assume he also thinks everybody that just
got their ct60 must be an idiot to buy such a slow thing.
I don't care if someone does contribute to the platform, it don't
automatically exclude someone from being a jerk. So far I've gathered
that demos, games, unix ports, and anything missing a gem front end is
complete crap and worthless to the platform. What I see is someone with an
agenda, with the sole purpose of slandering mint. Regardless of his
comments, which I now think are lies, he does indeed hate mint. But the
problem is the same, magic is in dev limbo, mint is not.

I am quite aware that other magic users do not think this way, in fact
Dennis is way out in left field. Anyone that would take this extreme
position that Dennis has displayed, isn't dealing with a full deck.

Probably DNS errors at your ISP. Try with http://65.161.254.20/ but I
guess you will run into errors anyway when following links on the site.

I might add that this site worked nicely with CAB so you can put orders
in the online shop etc. No offending Javascript.

Seems to be a good guy. I ordered some harddisks from him that were
listed in the Atari ST section. When he replied back with the exact model
the disks turned out to have differential interfaces and as Ataris have
single ended SCSI not compatible.

These disks are no longer listed on his site (at least not in the Atari
section) so it looks like he is doing his best to have only good stuff on
sale.

I agree. Imho most Magic users and developers are tolerant. Maybe tolerant is wrong word, i actualy dont tolerate Magic, im happy it exist! Its just my bad english... Magic is their choice, i wont question their choices and i respect that. I know many Magic owners, i am one of them actualy, and i really dont argue with them. I even seek for some Magic related tool and problem solutions for pals of mine, who havent inet acces (i do that mainly via email and in irc tho...). I also wont question their application choices. If thats Jinnee, which is Macos wannabee, or Emailer (not to original either) thats okay with me, those apps are not bad.

And to be clear: i dont have any troubles with MagicMAC/PC users. Or clone users. We have different views on clone/atari thing, but i doubt our arguing ever went overboard or became insulting... Since i didnt ever heard u say that demo coders are lamers, or dreamers or wasting time.. And u wont hear me saying Hades is crap, Milan developers are morons.. I will and did say, Milan is for me boring machine, it lack those aspect of Atari feeling i hapen to love. Same for MagicMAC: i just love nongem etc things a lot, so GEM only clone is not to nice option for me, but its still an option! And a lot beter one as PC/Mac and emulators still...

I will also use this oportunity for excuse if i accidentaly or in anger insult some of Magic users/developers. It was unintentional and i am sorry for that!! (i know we could say that MiNT etc is super easy to install etc, and it may in heat sound like that ppl who didnt succed 1st time, etc, are stupid.. That is NOT true! I know how odd Unix or CLI may be to GUI only user, i learnt that myself and learnt that hard way: with Watchtower1 linux distribution)

Hi

I laid my hands on the following Hard drive:

IBM DDRS - 34560

I did some search in the WEB and found few additional words
along the above:

single ended ultra-1 SCSI

Can it be a differential one?

Well, it might just have been ditched for a reason. ;-)

I suspect not. It should work. There were some fast and loose marketing words attached to hard disks, in hopes of selling newer ones.

If they have 50, or 68, or 80 pins on the back, they can all be made to work as SCSI-1 with an appropriate adaptor, which should cost less than $40 USD.

The 80 pin adapter will let you connect either a 50 pin connector or a 68 pin connector.

The 68 pin adapters come with or without pullups. You need the ones with pullups.

I think the differential ones have more pins, and can be distinguished on that basis. The number 120 sticks in my mind, but I could be wrong.

Anyway, this project begins with the task of counting very tiny pins.

Jim

No Mac advocate will ever answer those questions, no matter how many times
you ask. The best they can come up with is "I just like the Mac," and to
perhaps point you to a study that compares Windows 3.x to the Mac.

No. of pins does not generally tell if a drive i single ended or
differential.

On a single ended drive the signal lines have one corresponding line each
connected to ground. That is actually the reason you can have a 25 pin
connector like the Atari TT has at the back. The grounds are simply
"winded" together.

On a differential drive the difference between to lines makes the data.
Quite similar to how a linear balanced mirophone works, actually.

So, a 50 pin harddisk can easily by either differential or single ended.

Unfortunately, this model was made in both differential and ultra
forms.
You might try connecting it as a solo drive and playing with
termination combinations in the hope of making it work. It won't hurt
the drive or ST to do so.

5950. Gaim on Atari

Newsgroup: comp.sys.atari.st
Date: 2003-08-26 20:00:29 UTC
From: mduckworth@nospamatari-source.com
Message-ID: <1061927949.513716@toad>
Source record: 24231

Hey guys,

This may not be that newsworthy but it's fun nonetheless. Today I
successfully ported the most recent GTK 1.x version of gaim to atari!

Check out screenshots here:
http://aoi.atari-source.com/~mduckworth/gaim1.gif
http://aoi.atari-source.com/~mduckworth/gaim2.gif

Names have been blotted to protect the innocent. This has been done
mainly so I can chat while I'm developing GEM Instant Messenger ;-)

Indeed - I actually went there to ask a question that was rather
advocacy-related (allthough not provokative), and got no replies. Seems like a
desrted place to me - no one seems to want to advocate windows anymore...

I realize that Edwin. I knew the answer. I just couldn't believe how
many were arguing with me concerning it. It was so obvious.

Not by the MS bashers. One guy is trying to convince everyone to give up
Windows because the Sinclair ZX Spectrum was better than the original IBM
PC...

LOL

Since August 9, there have only been 52 messages posted that aren't
cross posted to include CSMA (there are only around 200 even if you
include the CSMA cross posts).

That's less than three posts a day.

Dead.

Weren't gone very long, this time, were you Edwin? BTW, tell your doctor
that the new meds aren't working any better than the old ones. It's back
to Happy Acres for you!

Rest assured you didn't say any of those.
I've heard a few times about msg archives, yet never a full msg with header
or some google link is provided. So it's all taken out of context.
Further more, any such comments if they are even accurate, came after
already being insulted *several* times...

Some one went to the SpareMiNT site, then came back here and said something
to the effect that what they saw was not for kids. Which leads me to think
MiNT is for adults, so I made some funny comment with a smiley about kids.
As you can see Dennis is again attempting miss-information...

There goes the Maccie claim that they don't post to Windows groups...

>(there are only around 200 even if you
> include the CSMA cross posts).
>
> That's less than three posts a day.

If there were more, you'd be claiming that the posters have no life outside
of Usenet. Typical Maccie double-talk.

> Dead.

Dead = Zero posts per day.

Edwin

Typical Edwin lies. You have no clue what I'd say. And you're not smart
enough to figure out that I *am* smart enough not to make such a remark
because it could immediately be turned back on me. <g>

A not-so-short time ago, I found quite complete specifications for
my IBM DSAS-series hard disk on <http://www.storage.ibm.com>; I suppose
that the address is still valid. There were docs for many different
types of IBM's disks there.

>Can it be a differential one?

If it says "single ended" than I suppose that most probably it is NOT
differential, but single-ended :) - depending how that "single ended"
information is reliable.

Bbtw. At least with the (older) disks having the then-standard SCSI-2 "berg"
connector (2x25 pins), one could -not- tell from the number of pins only
if it was differential or single-ended.

Bbtw. My IBM DSAS-3540 disk has a number of jumpers beside the usual SCSI-ID.
They had to be set just exactly right for the disk to work on an Atari.
After these initial troubles, it has been working nicely here for more
than five years now. It is very quiet.

After the C64, Amiga, and Mac (the 'real' one) now the Powermac is
currently my main machine. (On MacOS X, a BSD Unix machine, really -
these days, it's a bit sloppy to talk about 'the Mac' in general; the
old Mac is dead.)

It can run Mac apps beside MS-Office and Unix programs.

It can still network directly to an old Apple II(gs) and using the same
standard hardware use Ethernet to access things like the Internet.

Name another machine that does *those* particular tricks - and no, using
computer emulators doesn't count ;)

> The best they can come up with is "I just like the Mac,"

Hopefully, I did a bit better.

I still have and love my C64, Mac, IIGS, Amiga, Lisa and PET 2001
though. The PC is... well, used for games here, really. Grand Prix
Legends still rules the simracing world!

Everyone that answered did better than "I just like the Mac", it's not
that hard given the marginal usability of windows. The problem is that
is all they choose to hear.

Watch how they spin your response. :)

Source record: 24159

Fact is, I have a FULL at 50Mhz which will run at 66 or maybe a little faster, however, an LC at 75Mhz should be able to do 100Mhz with cooling (assuming other CT060 parts are happy with that) maybe a little more. Sure there are FULL 60 and 66 chips out there but they are realy hard to find.

The only down side I can see is that it is not possible to figure out if you have an EC or an LC chip so they both run as an EC (is that right?), if the FPU was enabled somehow (manual selection maybe) then you would only be missing the MMU which I am not that bothered about (Mint never worked for me!). Fact is I am not that nothered about the FPU.

I would like to see the results of a 100Mhz LC against a 66Mhz FULL, if it can be done I know which I think will be faster!

Thanks

Elliot.

If it *is* single-ended, then ist not differential.

However, from a web search, you can't be sure which version you have - many
SCSI drives are available in both interface variants.

>Ok, we are getting somewhere now. You are stuck because you can't run
>MiNT under magicmac. But again that is the path you took, yet you
>project your frustration on others who can do more.

MiNT is installed on the TT, it has a 2 GB ext2fs partition all for
itself, that's 2 GB wasted space reserved for future crap....
I can't run MiNT under MagiCMac that's true, but I can run MacMiNT under
the Mac OS.... that's an adventure by itself :-)
IIRC it's also installed on that clone in the closet, so that's three
times MiNT on three different computers... still think I'm frustrated?

>Why not dust off the clone and sell it to someone who wishes to remain
>true to the platform, someone who doesn't want to use a mere emulator.
>Take the money and get a faster mac.

That's my business.... I don't advice you to sell your mac and use the
money to buy a CT-60 powered falcon either.

>

>reference point to compare speed, as magicmac isn't really qualified as
>an Atari. It's merely a 68k emulator, which has a poor design as well,
>since it forces an OS apon you that you cannot swap out.

Hey wise guy... look at google, they've got an even more massive mgs
archive. Whenever I made comments on speed, I always made it clear that
it was on a TT... if I would have used these from MagiCMac you all would
have declared me nuts... like I said in the previous mail, the G4/800
runs MagiCMac at almost 20X the speed of a 68060/50Mhz...

>I have magicmac for both os9 full version, osx demo. I also have a
>mac of course, fairly new one I might add. However, I will not and I
>do not use magicmac for anything but looking at HYP files. I have found

Of course you don't, it's a kiddie OS, remember?

>>Still think it's a good point? I think it's a stupid to make
>>point... Kobold, Papyrus, Phoenix database, GFA basic etc... are also

>>available for the PC, existing on a different platform, doesn't say
>>anything about the quality of the software...
>
>GFA-Basic is effectively dead on the PC. Case anyone wonders. ;-)

It sure is, just like Kobold, Phoenix database, Xact etc...

>So what's your real grip with me, now that I know you are a mac user,
>are you upset that aIRC don't run under your emulator?

You know very well what the grip is all about... and calling me a Mac user won't help solving the matter. Stop this ridiculous campaign, and so will I.... continue it and together we'll probably destroy CSAST...

Cheers from Belgium
Dennis

>Let me also say even though I don't find anything Steeve says of much
>value, since his posts tend to contain foul language, he is however
>a genuine Atari user, unlike Dennis and his emulator.

First of all, let me say that you are pathetic...
I knew it would eventually happen, and it did. When I killfile someone I'll never reply to his posts knowing that I'll get to see only bits and pieces of selected quoted text in related posts from that person...
And that's exactly what you've been replying to, you moron !!!
If you would have read my post, you would have known the whole story, so sit on it, you idiot...

My TT runs 24Hrs a day, it's been running non stop for almost two years now, I don't need to receive lessons from someone using a clone, I've explained why I've put my clone in the closet and why it'll remain there. You wouldn't recognise a genuine Atari user if you bumped into one... just like your Mac, your clone is a machine without a soul, and I can make this statement, because I speak from experience. Ain't it funny how the kettle tells the pot he's black? Tell us Lonny, which genuine Atari computer you're using besides that fake Hades, and it is a fake, a patched TOS on a motherboard does't turn a computer automatically into a genuine Atari.

You've really made my day :-)
Thanks

Cheers from Belgium
Dennis

>sometime now. So who is really spreading false information? You are
>the one that is beating down many things you have never tried. If you
>wish to be remember as the most narrow minded individual here, just
>keep it up.`

Narrow minded? do you perhaps think that you are the "only" registered
PotoTip user?

>I stated it was a fine app. You can twist it into something else if
>you like, or perhaps you should seek some sort of English translation
>refresher course.

I don't think so... who do you think wasted two months of his life
translating the app and docs? Derryck and me wasted our time on it, why
didn't anyone told us that there was something far more better available?
And I'm not going to tell you who you have to thank that it even runs on
MiNT, you wouldn't believe it anyway, let's say his name starts with an S.

Cheers from Belgium
Dennis

Hi Lyndon,

>I've never had a Nova, or even seen one. The cards work fine in a PC
>ISA slot, thats why I said I can provide further information on the
>chipset or photos of it. If its anything like the Eclipse, only some
>ATI cards work. I do know the ISA version is rare, I had to buy some
>from USA.

Most of the ATI Mach64 cards will work without a single glitch, but....
(unfortunatley there's always a but...)

The NOVA interface contains a GAL, there are four types of GAL's, one
for every type of card:

- ET 4000
- Mach32
- Mach64 without VRAM
- Mach64 with VRAM

Putting a Mach64 card into an interface with for example a GAL suited
for ET4000 cards, will either give a shifted/scrambled display or no
display at all... so it's essential that one has the correct GAL fitted
on the interface for the Mach64 card, sorry for the rather bad news...

Cheers from Belgium
Dennis

From: Janez Valant <swe@atari.org>
Date: Sun, 24 Aug 2003 23:05:37 +0200

Hi,

>Again, again and again u showed yourself as MASTER of twisting and turning
>the facts as u like... WHERE did i say developers MUST develop apps only
>for MiNT. I said like 100 times, that if application is developed in
>accordance to GEM guidelines, it will work in MiNT, Magic and TOS...

I know you've said it a 100 times... and I've asked you a hundred times to name me the apps, I'm still waiting BTW. I can only conclude that there are no MiNT users developing apps which run in accordance to the GEM guidelines, but you'll call that twisting words around ofcourse... So let's one straight question, and please reply to it in the same manner. What apps have been developed by MINT users/coders/developers that run on the three OS's? And I said apps, not drivers or utilities....

>and to blame them is as stupid as to blame Andreas Kromke why there is no
>new Word proccesors and other apps.

There is a new word processor, and it's better and faster then anything you've ever seen on this platform...

>Only have one question for you: IS magic a CRAP? Did i EVER call Magic a
>crap, or let say Iconnect and Iconnect related apps since they are bonded
>to one OS? I didnt. WE didnt... I have no use of those apps, they ARE OS
>specific but i still wont call them a crap.. Many arent bad apps at all,
>just wrongly designed....

True you didn't, but then you are the odd one out.
Iconnect and the Iconnect clients are OS-specific, just like MinTNeT and the MinTNet clients are OS-specific, but apart from the Iconnect issue I really don't know any other MagiC-specific apps... do you?
Time and time again the MagiC-specific apps are slapped in my face, but when I ask to name a couple from that *lot* all you guys can come up with are the IConnect clients....

>No one twist them, now how can Pine be OS specific? From SAME sources it
>run on MiNT, Linux, Irix, Macos, BeOS, Windows, and some 10 other OSes. And
>no, i wont buy PC or Mac, if i can make a task on Atari. U prolly also
>watch jpegs on Atari, or GIFs, u dont just watch PI* or NEO pics and use a
>PC for alien formats.... The money saved ill rather spend for buying and
>suporting remaining Atari developers (which make apps according to GEM
>standards, so they run on any OS)

Ofcourse you twist words.... I'm talking about OS-specific apps on this platform and you give me platform platform specific apps. I don't give a damn on how many platforms an app runs. This is the Atari platform, and that's the plaform we're discussing here... an app only running on one of the three major used OS's doesn't really deserve to be called "Atari program" if you ask me...

>Really.. U didnt say Airc is crap, u just called him a thief etc.. and
>make suggestions bout stealing code etc.. remember that thread?

No I don't remember that thread.... I didn't partcipate in it.
I've asked Lonny and ozk to produce or quote the reference number of the post, and now I'm asking you... you're number 3 now who accuses me... I've also been accused of making fun of your mother while being very sick, ever remember me making such a statement?

>:))) Your nick should be Twister.... I knoiw u use MagicMAC and did i EVER
>use that against you. But u have the balls to use alien hardware, on that
>hardware use alien OS/apps BUT spit and insult everyone else who just use
>some alien apps (AGAIN: as bonus feature) in order not to leave Ataris in
>closets!

I use MagiCMac on the Mac and MagiC on the TT. Sometimes I use the TT to post here, other times the Mac... it depends on what machine I happen to be busy. The TT runs night and day, it's always available when I need it, and take it from me Janez, it's still being used very intensively...
What I ment to explain was that even if someone has a Mac or PC, there's no need to start using specific stuff to post or mail here. The Atari software is capable, very capable if it comes down to it. People using Entourage on a Mac to post here, are the ones with the balls....
For the record: there are no Atari's in closets here, the only computer that is gathering dust in a closet is the clone, and that clone is not a real Atari anyway, because just like the Mac it has no "soul".

>But u use Mac, love Magic (all okay with that), which wasnt updated in
>years, spit and insult everyone, no matter if thats MiNT OS developer

The English MagiC was updated february 2003, when was the last MiNT update again.... gee, how time fies...

>(who actualy support Atari a lot) or me, since i dare to used alien apps, to
>have cable working on my Ataris, or since i ran pine or ircii (altough i did
>say i then stated to use Amail) or anyone else not fitting in your scheme.
>Thats pure hatery. U just cant say, or type, that MiNt is a good and
>definately an ATARI os, that its developers makes great job, u rather left
>all such parts from replys and use parts in which u only can spit on ported
>apps...

I've written it time and time again, but you don't want to read it.... MiNT is OK, it's the crap that's being produced for it that is not OK...

>Use it as u wish... But remember, in my eyes your Atari spirit does not
>grow up, since u use Mac and have Ataris in closets... Its totaly your call

Are you deaf? The only computer in the closet is the clone. And I don't care
if all the clone users now join in also: a clone is not an Atari....

>> You can port the apps and start them up, but there's no way you'll ever
>> see them "run", at best they'll "crawl" on a Atari, clone or powered
>> Falcon. And anyone stating different in my book is a dreamer...
>
>Well I am a dreamer then... We talk bout ports here, and there is one
>fact u dont know: CLI ports run preety fast, even on plain machine. Even
>those with NCURSES GUI. Even more, running them makes a lot less stress on
>CPU as GEM/GUI apps. That dont apply to all apps, but Pine, ircii, lynx,
>ncftp... runs, not crawl, happy. So i am stating that, and u run some 1st,
>then make judgements.... X apps are the one which are harder to run....

This is like an old cracked record running. I'm talking about apps that the
average user needs, and here you are dishing out the same stuff again. Why
didn't you put Ghostscript in that list? And when can we see an office suit
or parts of it being ported, according to your logic, it should run smoother
then what we've been using up until now.... like I said: keep on dreaming :-)

>If your ISP cancel dialin and go cable/adsl only, MiNT can adopt fast. that
>is done already, but if some of inet services change specs, maybe to ipv6 or
>something like that, MiNT will provide drivers fast, on OS level,transparent
>to apps. That is not joking anyone, those are facts (i gave me as an example
>with my TT). Other example are unixfs drivers, fat32, amigaFS drivers etc..
>Its not important that virtualy noone can benefit from AmigaFS, important is
>that its easy to add such stuff, and that its done on OS level and
>transparent to apps.

We have a conflicting view on this issue, we can discuss it for another ten
years, we'll never see eye on eye on this. For you the OS is the most
important factor, for me it's the apps that run on that OS that are the main
factor. You may have the most advanced and stable OS in the world, without
apps taking advantage/showing it off, then in reality you've got nothing.

>>at the time that SSL
>>was developed for MinTNet it was iilegal to export it out of the States.
>>The programmer of IConnect didn't want to break any laws, and that's
>>probably the reason why all the other stacks haven't got SSL either but
>>IMO this isn't an OS related matter...
>
>Please... So now are US laws quilty that no SSL? As u say "probably",
>since u have no clue...

I know for certain about Iconnect that this was the reason, I wrote probably
for the other stacks, because I indeed have no clue...
but applying a little logic goes far...

>>BTW: I work in a bank.... and I've seen too many horror stories the last
>>couple of years. I would **never ever** use e-banking. And no, I will not
>>comment further on this issue.... work it out for yourself.
>
>I will, u dont use/need it.. so coder is an idiot to make it... And do i

>really need to tell ALL. Its not just ebanking, its also ordering things
>via browser etc etc.. i did order few things sucessfully via inet and credt
>card....

Who said I don't need it? I said that I would never ever use it. But there's
a difference between e-banking and paying/ordering goods online. I'm not
allowed to make public comments on e-banking related stuff (non disclosure-
agreement), but I've ordered a lot of stuff with CAB also, without needing
SSL and Java applets. If a site demands this, then I just move on to another
one, there's enough competition out there. And I haven't met a dealer yet who
didn't want to sell his goods if I ordered them by email...

>Yes let's be fair: what' wrong with ext2fs partitons? Or Minixfs
>partitons? Or FAT32? Nothing. MiNT has them all. And Inode based ones are
>more reliable as FAT table ones...

There's nothing wrong with ext2fs partitions, did I say there was something
wrong? I just added FAT32 because you overlooked it...

>Dennis, WHY are u doing this, i know u are not SO stupid. Thats EXACTLY
>what im babbling here for quite some time and u ignoore... And now repeat
>that as own invention. Those coders code ATARI apps. And those apps work on
>any ATARI OS, sometimes TOS is excluded. They work on ANY OS because OS
>developers made their OSes compatible... Im telling that for long here..

We might be "babbling" about the same thing but we have conflicting views on
the issue :-)

>Those coders do not develop MiNT ot Magic apps, just GEM apps. Money has no
>issue here, i did and do pay for apps i use. I also want to reward coders
>for hard work... And if there is app i dont like/use/need i STILL test it
>and usualy send friendly message, i dont call them lamers if they happen to
>used Magic AES methods...

Fine, I've already asked to name a couple of these apps... and I'm honestly
not doing this on purpose: I just don't know and never heard of these apps
that are coded by people using MiNT as basic OS. I know it sounds silly but
it's like nothing ever appears from that corner of the world... not the kind
of apps that you mentioned, if we're talking about CLI or OS-specific stuff
then it's different of course.

>Well this part is easy. XaAES is now part of official FreeMiNT CVS tree,
>but its not good enough yet. Thing is NOT Free, so can't be added as well.

Yep, Thing is shareware, I have no clue why this is an issue so I'm not going
to comment on it. But be realistic, how can you claim an easy all in install
when the package contains no desktop?

>> There's nothing bad about it... I'm not even remotely interested in
>> anything coming from the unix world. And from what I've written above it
>> should be crystal clear that I don't believe in the fairy tale about that
>> stuff helping
>

>What u believe or not is not neccesary to the right thing... U arent
>remotely interested in stuff came from Unix world... Okay, so u dont use
>Anodyne CD writer software, Aniplayers jpg/mpg etc decoders.. and so on..

True... I use CD Recorder Pro from SoundPool, and I don't use Aniplayer at all, Photoline depacks jpg's much faster, and as for mpg... on the TT these are played at 3 fps, on the clone it used to be in slow motion, so I watch mpg's on the Mac.

>Thats all tale for you... U think its tale. But i AM offended by many of
>your bashings, i repeat bashings, not criticism in proper way. Result is,
>that i stopped seeking for problem someone reported for GGT2 on Magic. And
>that purely cause of your mouth... But ah, u dont care bout that or the
>GGT2, it wont run on Mac anyway, so i guess i "can crawl in pit i crawled
>out...."

Well Janez, that a poor attitude. If every film director, song writer or novel writer would pack it in because their efforts are being critisized then their wouldn't be much left anymore... As for GGT2, I don't even have a clue what it is, so I'm pretty sure that I've never commented on it... if it's been bashed or critisized, it wasn't me (for once).

>There are serious apps, which directly came from demo coders or their
>techiques. U dont need to cheer demos if u dont use them, but since u dont
>exactly create anything, dont call them crap, since many demos are coding
>wonders, and coders lamers etc....

I create a lot of noise.... and I mess around in others their work, so don't say I'm not creative. :-)

>I dont want to hear comments. I want u to recognize a chance to sent
>comments and suggestions (not bitching) to HW developers. Instead of
>monaing about no Iconnect support, be usefull, talk with them. If Iconnect
>is NOT open to others, then rather blame Iconnect authors. U may ask them
>if they can make them open. Or u may use iffusion, and it will be ok, since
>Highwire is Stik compatible... Or its really easier to declare it usefull
>and crap?

IIRC it was claimed that HW would be a replacement for CAB?
When it's finished I expect to see a program that is better then CAB, better means more stable, html 4.0 compliant, etc... but I do expect it to have at least the same features as CAB also. One of the nice things about CAB is that it can be used with almost any stack, the fact that I can use Ifusion to go online with it, is not a valid point. This program is still in beta, so I give it the benefit of doubt, that's also the reason I don't "bitch" about it, but if the final version doesn't support Iconnect then I'll put that as a negative point in my book. As a matter of fact, for me it might be a reason not to use it at all. And I'm not the only Iconnect user in the world. If you ever used Ifusion then you should know that it slows the whole lot down quite a bit.... that doesn't matter much for stuff like email or newsgroups, for a browser however it's different.

>Better as bitching. And opposite way is: u seems to dislike
>any open stuff, u are covinced that ppl who charge are better coders...

I'm convinced that ppl who charge are more dedicated, "better" is not the exact phrasing, the "chargers" have an incentive to code, even if they are not in the mood or it's beautifull weather outside. I don't really dislike open stuff, but so far I haven't seen much coming from that corner which should change my views on it, in general it goes like this: something is declared open source, some people are rumoured to be working on it, and that's it. I gave you QED and Chagall as two examples, but you've choosen conveniently to overlook those. I gave these two examples because I was so stupid to "contribute" to these, in amid two projects which took all our attention, Peter and me took the time to mail over sources, translations, docs etc to the guys working on Chagall, I had to literally turn the place here up side down to find all that stuff back. I was even stupid enough to edit and translate large parts of it to make it easier for them to grasp, and what have we got to show for it ? peanuts....
It's not the first time this has happened, so yes I bitch at the open stuff corner. I've never experienced anything like this with coders who "charge", they deliver and get the job done...

You accuse me of bitching, while you haven't got the faintest clue what I do and contribute in the background....
TBH: I'm fed up contributing, when dreamers get in touch with me, they ask for sources, beta's, translated docs etc... that's stuff I've put a lot of time, work and sweat in, it's not appreciated and if I mail it over nothing happens with it... from now on I'm gonna keep it all locked away in the closet. Just like you don't wanna continue working on GGT2, I'm through with handing out my stuff, let's face it, you've said it yourself.... it has no value

>If Iconnect is NOT open to others, then rather blame Iconnect authors. U may
>ask them if they can make them open. Or u may use iffusion, and it will be
>ok, since Highwire is Stik compatible...

I don't have to ask anything at all.... it's the coders who must ask for it, and to your and their surprise they will get all necessary info, and if the info isn't enough they'll even receive help. ASH has never refused handing out the specs of Iconnect, but if nobody care to ask.... how do you think that Vassilis implemented it in MagicNet? I know... and he knows.

The info will be in German of course, if the coders don't understand it, all they have to do is to contact me, and I'll translate it for them. If they don't want to deal with me, fine, I'm convinced that Derryck or Peter will do it without any hesitation also. And the same thing applies to MagiC.... the fact that it's not open doesn't mean that it's top secret, if you have a problem get in touch with the author, he's not a monster.... as long as you don't ask to make it open source I'm convinced he'll give you all the needed info.
That silly argument that something is not open has been used time and time again here... except perhaps for one or two programmers, all the people that code "closed" stuff will be jumping up and down if you contact them... but it's easier ofcourse to say that it's closed and not bother at all with it.

Cheers from Belgium
Dennis

Date: Thu, 21 Aug 2003 23:52:13 -0400

>PhotoTip is a program. That is it's main purpose, to access serial
>based cameras. Without that feature it would pale in comparison to
>other such printing/scanning apps.

That particular feature can't be compared with other printing/scanning
apps since there aren't any for this platform. Someone who wants/needs
his printer and scanner to work as a colour photocopier can only use
PhotoTip for this purpose. So like I said, that feature on its own is
worth the price....

>>>It's just like in 'The Matrix', the problem is "choice".
>>>
>>In this particular case there is no choice...
>
>There's where you are wrong. You just think you have no choice, since
>you took the path you took.

I've just explained that I'm not wrong.... and even if I was, I prefer
taking the shortest route. With photoTip I can catalogue, edit, delete,
put back, number, time stamp, produce thumbnails in html format, print,
send scanned pics to the camera, send pics to the camera in sequential
format, delete protected pics, rotate and scale the pics in the camera,
etc... it has a feature list which is a mile long. One program for all
tasks... that's called efficient working, what you propose will do the
job also of course, but why make it difficult if all can be done from
single app?

Another thing which that CLI lacks are the long established protocols
and standards, and it's that stuff which makes using Atari programs
different then on any other platform....
Long filenames, AV protocol, Drag&Drop protocol, xFSL font selector,
DHST, ST-Guide help, Bubble help with BGH support, Display and printing
using NVDI5 routines, MagiC-style window dialogs, GDPS scanner interface
Threads under MagiC, GEMScript etc....
All that stuff sets this app miles ahead of your ported crap... and yes
sorry, but in comparisation it's crap... and I don't care that it costs
nothing, that's no excuse.

>It wouldn't kill you to have a dual boot system.

I have... TOS and MagiC :-)

Cheers from Belgium
Dennis

5992. AtarICQ 0.159 is released

Newsgroup: comp.sys.atari.st
Date: 2003-08-27 14:10:48 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.lbjsdaci@localhost>
Source record: 24163

Hi all,

A new release of the Atari GEM ICQ client for STiK is now available.
This time the following major changes have been made:

* Sound can now be configured in preferences dialog (Please read
the HYP!) * Fixed a problem causing aICQ to enter "away" mode also
when user wasn't idle * Right click on search results (UIN) will
open "add contact" dialog * Support for several languages updated
(French, German, Polish, Swedish) * Quite a few bugfixes, see
update.txt for details

To download and read more about AtarICQ, please visit www.ataricq.org

Regards,

Joakim

But its a very nice obscene, slime covered tower at the bottom of the
Pacific Ocean. If you ever saw it you would be SO jealous.

OK, not being a technicien, that was what I wanted to know. :-)

> However, from a web search, you can't be sure which version you have -
> many SCSI drives are available in both interface variants.
>

Thanks everybody for most learning replies.

The disk has 50 pins.

I have set the following jumpers:

1 spare = 0
2 id bit 2 = 0
3 id bit 1 = 0
4 id bit 0 = 1
5 enable autospin = 0
6 scsi termination = 1
7 disable unit attention = 1
8 ti sync nego = 0
9 autostart delay = 0
10 delay start 6/12 = 0
11 disable parity = 1
12 led out not connected

AHDI recognizes a scsi disc on 1.0 but doesnt get a name.
After that the correctly recognized disk on 0.0 cannot be read
and the TT starts up with the empty desktop although there
is a C harddisc icon below the standard A & B icons.

Looks like the termination thingy.

I havnt tried jumper 8, 9 & 10

Maybe you have Air Con, the UK has not ben that cold recently, we have had a good few days peeking at 38 - 39 and the general temp over the past few months has been in the late 20s (cooler now though).

Mine also appears to run cold. What speed CPU do you have in it, mine is LC 66Mhz, a FULL 50Mhz may well get much hoter as it is being overclocked and has more stuffs inside.

Elliot.

Which still does not mean much - both single-ended and differential have 50
pins if narrow (8-bit) SCSI is used.

>AHDI recognizes a scsi disc on 1.0 but doesnt get a name.
>After that the correctly recognized disk on 0.0 cannot be read

>Looks like the termination thingy.

Might also be a drive that *requires* bus arbitration. Use the SCSI port on
a TT or Falcon, try to use HDdriver with arbitration enabled. Connect the
disk to an external power supply and power it up *after* the machine has
booted, and then start the driver, because TOS may access the disk without
arbitration during boot, which may be enough to make the disk look dead.

Otherwise, it may still be a differential interface.

cu

Dennis do u do this on purpose? Im talking, 100 times, that there is no MiNT/Magic developers when it comes to apps. There ARE only Atari apps. MiNT developers are guys developing MiNT itself, and Magic developers are guys developing Magic. Since they do care bout Atari, noone of those oses require special coding. The only exceptions so far are Iconnect and MiNT Net stacks and Magic objects. And if u want straight answer:

Lonny did AtariIRC, he is MiNTer, Atack guys did Aftp, Amail, they are MiNTers as well, i did GGT2... Still i repeat, those apps run widelly and they cane be put into category "MiNT application coders" There is no such category.. I know ud like to spit on it, but there is nothing.. Being Magic user, or MiNT, most use either GFA, or PureC or Devpac or Tasm.. even GCC users have to use GEMlibs. And call for fileselector, or window opening etc is exactly the SAME for both OSes as its all GEM, bios, Xbios calls, except from those MiNT or Magic have extra....

>>and to blame them is as stupid as to blame Andreas Kromke why there is no

> really don't know any other MagiC-specific apps... do you?

Dennis, rare oportunity i use hard words: "FUCK YOU" U asking me this question? After my kazzilion messages that there is actualy NO MiNT ot Magic apps! Even Iconnect client or MiNT NET client would work under "other" OS with simple stack translator, same as Stik and Adamas apps runs with MiNT net. I claim that from beggining, and now u came up to me with this? U are on other hand, all over MiNT developers etc, because of ports, for which i said, also kazzilion times, that they are necessary for some tasks and EXTRA feature.. U keep showing them as MAIN feature of MiNT!

> Ofcourse you twist words.... I'm talking about OS-specific apps on this

And who the fuck calls them Atari program?? I never did, noone actualy never did. U also forgot i mentioned i used Pine, but migrated to Atack mail, when it came out... Exactly the same reason as mentioned here.. But u have selective memory....

> I use MagiCMac on the Mac and MagiC on the TT. Sometimes I use the TT to

> Atari anyway, because just like the Mac it has no "soul".

Still GEM apps ran in MagicMAC relies on MAC open transport, MAC eth drivers.. same as my GEM apps relies on nfs, unix sockets... Why my way is bad, and yours is good? Apart for few CLI apps, i use GEM stuff only, from same reasons as u do, yet u bitch me and question my way...

>
>>But u use Mac, love Magic (all okay with that), which wasnt updated in

Dennis dont throw updates of an emulator in my face, tell me about Atari Magic update. I do NOT wanna buy Mac to be able to use newest update of an ATARI OS, thats ABSURD. And about MiNT updates, im really happy u mentioned that, obviously u didnt care to look on pages i suggested, so ill help you:

2003-08-19 Tuesday 14:38 Standa Opichal <opichals@seznam.cz>

* sys/dosdir.c:

Fchown() syscall semantics changed to follow symlinks.

This is now in sync with the libc specification.

The mintlib falls back to Fchown() if the new Fchown16() syscall
is not present (older kernel is in use).

2003-08-19 Tuesday 11:28 Standa Opichal <opichals@seznam.cz>

* sys/: dosdir.c, dosdir.h, syscall_vectors.c, syscalls.master:

Adding the sys_f_chown16 syscall that is like sys_f_chown() but takes the
extra 'follow_symlinks' argument.

This is usefull to implement correct mintlib chown() and lchown() calls.

2003-08-19 Tuesday 11:25 Standa Opichal <opichals@seznam.cz>

* sys/: CONFIGVARS, arch/magic/Makefile:

Adjusted to be able to propagate CVS/CONFIGVARS GLOBAL variable setting.

This is usefull e.g. when you have the libc in other than default directory
on your system to specify the -I and -L paths.

2003-08-08 Friday 11:49 Adam Klobukowski <atari@gabo.pl>

* doc/programmer/newcall.html/shutdown.html:

Little bugfix (sorry)

2003-08-08 Friday 11:45 Adam Klobukowski <atari@gabo.pl>

* doc/programmer/newcall.html/shutdown.html:

Update about poweroff mode

2003-08-07 Thursday 09:31 Adam Klobukowski <atari@gabo.pl>

* sys/: cookie.h, dos.c:

CT60 poweroff support

2003-08-02 Saturday 17:03 Frank Naumann <fnaumann@freemint.de>

* sys/init.c:

Added missing #ifdef VERBOSE_BOOT.

2003-07-29 Tuesday 12:11 Jens Heitmann <jheitmann@debitel.net>

* tools/mgw/: main.c, syscalls.c:

Bugfix: EOF check in check_exception (called by select)

2003-07-28 Monday 20:49 Michael Schwingen <rincewind@a-tuin.dascon.de>

* sys/biosfs.c:

- disable (broken) biosfs support for Milan UARTs - use the XDD instead.

2003-07-28 Monday 20:48 Michael Schwingen <rincewind@a-tuin.dascon.de>

* sys/init.c:

- re-add code to run ROM AES: GEM=ROM sets init_is_gem==1 and init_prg == 0
- do not hook into reset vector - this should not be necessary, and can
cause problems on MagnumST

2003-07-28 Monday 20:46 Michael Schwingen <rincewind@a-tuin.dascon.de>

* sys/: info.c, info.h:

- add message for ROM AES

2003-07-28 Monday 20:45 Michael Schwingen <rincewind@a-tuin.dascon.de>

* sys/cnf.c:

- re-add code to run ROM AES: GEM=ROM sets init_is_gem==1 and init_prg == 0

2003-07-28 Monday 18:10 Konrad M. Kokoszkiewicz <draco@obta.uw.edu.pl>

* sys/mis.c:

Corrected the number of seconds in a Gregiorian year
for internal time calculations
(it is 365 days, 5 hours, 48 minutes and 45 seconds, and not
365 days, 6 hours, 11 minutes and 15 seconds :-))

2003-07-12 Saturday 16:46 Odd Skancke <ozk@atari.org>

* xaaes/src/: bootup.c, kernel.c, menuwidg.c, xa_shel.c:

Fixed Ssystem() call to get conterm value, fixes kbd repeat.
Fixed a problem caused by small apps terminating too fast, causing parent
code after Pvfork() call to work on a freed xa_client structure by
blocking sigchild longer.

2003-07-01 Tuesday 06:55 Jens Heitmann <jheitmann@debitel.net>

* xaaes/src/xa_form.c:

Fixed <RETURN> problem, with dialogs containing only
one edit field and no default button. (Was inserting
CR chars before)

--- snip ----

Here u go, MiNT and Xaaes updates, last few weeks, its updated almost
daily....

> I've written it time and time again, but you don't want to read it....
> MiNT is OK, it's the crap that's being produced for it that is not OK...

There is EXACTLY the same ammount of apps produced for MiNT as for other
Atari OSes. Excpet, again, for MiNT or Magic setup tools, if any in work..
the rest are ports from Unix world, addition to MiNT or Unix as i wish, not
for Atari directly, altough daemons or drivers may add to functionality of

GEM...

> Are you deaf? The only computer in the closet is the clone. And I don't
> care if all the clone users now join in also: a clone is not an Atari....

In not deaf, i just dont believe you. U put clone into closet cause its too slow, and now u use slower TT all the time? Why are u bought clone in 1st time, if its so not Atari?

> This is like an old cracked record running. I'm talking about apps that
> the average user needs, and here you are dishing out the same stuff again.
> Why didn't you put Ghostscript in that list? And when can we see an office
> suit or parts of it being ported, according to your logic, it should run
> smoother then what we've been using up until now.... like I said: keep on
> dreaming :-)

Dennis, u are abusive and make idiot out of me... Read my messages and ull see that i ALWAYS noted, that Xapps are slow, i also noted that GhostView is slow. I did also say, since i used it, that KNews wasnt so slow. Where the fuck "my logic" fit in? Stop abusing what i wrote and forget the hatery, what evil i did to you to deserve it?

> We have a conflicting view on this issue, we can discuss it for another
> ten years, we'll never see eye on eye on this. For you the OS is the most
> important factor, for me it's the apps that run on that OS that are the
> main factor. You may have the most advanced and stable OS in the world,
> without apps taking advantage/showing it off, then in reality you've got
> nothing.

Dennis, now u coinvinced that u dont wana let it go... That u genuine hate MiNT, MiNT users and all related.... I/WE may say XXX times that BOTH OSes run the same apps. And what matter OS better is how to serve those apps, and MiNT does that better. Same apps as on Magic, can do more things a same apps on Magic. Period.

> I know for certain about Iconnect that this was the reason, I wrote
> probably for the other stacks, because I indeed have no clue...
> but applying a little logic goes far...

Yes u know all....

> Fine, I've already asked to name a couple of these apps... and I'm
> honestly not doing this on purpose: I just don't know and never heard of
> these apps that are coded by people using MiNT as basic OS. I know it
> sounds silly but it's like nothing ever appears from that corner of the
> world... not the kind of apps that you mentioned, if we're talking about
> CLI or OS-specific stuff then it's different of course.

Really? Atack Mail, Atack Ftp, AtariIRC, EmuXL, GGT2. And prolly a lot more, since we realy cant say what OS authors use.. Many coders use singletos for coding anyway.... And they are all GEM apps, not Magic apps or MiNT apps... i dont know what u wana push ans prove here....

> Yep, Thing is shareware, I have no clue why this is an issue so I'm not
> going to comment on it. But be realistic, how can you claim an easy all in
> install when the package contains no desktop?

Find me my message, where i claimed its easy, and not noted obvious problems or catches? And where i didnt offer help? I always agreed or warned ppl with possible problems....

And at this point ill stop... U acting insulting and patronising, answering my claims i didnt say. I can not prove ONE point here, u all twist ALL out so why the heck ill loosing my nerves and time here. U dont mean nothing to me, enjoy tortuing other ppl's RSC's, bitching on coders or MiNTers i dont give a shit anymore. You think so high of yourself, but i remind u, translation is not creation... Do not forget that. U may translate Einsteins relative theory to Klingon if u wish, that wont make a physicist out of you.... And u add to scene aproximately that much... A bit of balast

Dennis babbled:

> People using
>> Entourage on a Mac to post here, are the ones with the balls....

The mac here has a purpose, inet use. I got fed up with Cab, and flip flopping back and forth between the 2 machines. At least I'm not sitting behind my mac pretending it's an Atari with an emulator. Cab, yet another app from ASH, dead in the water...

Beside, you use Opera and other mac apps, just happens you don't use a mac mailer, so you have no leg to stand on with such a comment anyway. I'm guessing you are using os9, as OSX is unix based and so very scary. lol

Try jumpering 5, unless you already tried it and found it did not help.

The disk has to be spinning before it can be read, but some other machines start the motor and wait. If that makes the disk spin when power is applied, it is what you want to do. You should be able to hear that.

I have had that particular symptom when I had the external disk set to address zero.

Does your drive have an on-board LED to indicate it is active? That LED should illuminate when you apply power, as the drive initializes itself, stay lit for a few seconds, and then go dark.

If it never goes off, the drive may be dead, or just disconnected. If no on-board LED, hook up the external. There are only two ways, and one of them is right.

Since the logic true state of jumper pins is a bit uncertain, first do what is necessary to get the thing spun up when power is applied, and that might mean fiddling a bit with jumpers, particularly 5, 9.

If it does spin up when power is applied, and it is connected properly (you can get an incorrect connection from a 68-pin drive with a 50-pin adapter with no pullups), there is likely an unfixable problem.

Jim

: Thanks everybody for most learning replies.

: The disk has 50 pins.

: I have set the following jumpers:

Yes, I have that. There are some other settings in there but GlueStik
does work with my Broadband network connection.

I suspect that the traffic is going to the default route (rtk0)
my network card instead of ppp0 The message "default route already
exists" suggests this to me.

Aug 27 20:24:01 milan pppd[114]: pppd 2.3.11 started by root, uid 0
Aug 27 20:24:03 milan chat[115]: timeout set to 60 seconds

Aug 27 20:24:33 milan pppd[114]: Connect: ppp0 <--> /dev/ttyS1
Aug 27 20:24:47 milan pppd[114]: default route already exits

```
Aug 27 20:24:47 milan pppd[114]: local IP address 195.74.115.192
Aug 27 20:24:47 milan pppd[114]: remote IP address 195.74.115.1
Aug 27 20:26:47 milan pppd[114]: Terminating on signal 15.
Aug 27 20:26:47 milan pppd[114]: Connection terminated.
Aug 27 20:26:49 milan pppd[114]: Exit.
```

I just tried starting pppd, deleting the default
route and entering:

```
route add default ppp0
```

this is wrong, it just said:

```
cannot add route: Network is unreachable.
```

The route looks like this:

```
bash-2.05a# route
Destination Gateway Flags Ref Use Metric Iface
192.168.0.201 * UH 1 0 0 lo0
192.168.0.0 * UD 1 0 0 rtk0
127.0.0.0 * U 1 0 0 lo0
127.0.0.1 * UH 1 54 0 lo0
195.74.115.192 * UH 1 1 0 lo0
195.74.115.1 * UHD 1 0 0 ppp0
```

Thanks for the help.

Regards,

Peter

What are you connecting it to? Also, I've run into a couple of drives
over the years that worked with external terminators but not with the
termination jumper. Try a few variations.

Mhmm.. A Hades has a hell of a lot more soul than MagiCMac. And lets talk about Soul. You and lp have no right to argue because NEITHER of you use the computer for it's "soulful" parts, like the ym chip, non-gem applications, etc. Dennis you have MagiCMac, lp you have a Hades - you're stuck with GEM apps. Run them on anything, who gives a shit.

But the problem is that Dennis has been arguing from the position of a real Atarian. Someone sitting on a "slow" box. Well your TT and your Milan aren't slow boxes... period. And MagiCMac has a hell of a lot less soul than a Hades! IMHO, A Hades and a Milan are ATARI's, even if they don't have the name on them.

But that's just my opinion. I can't believe I managed to even respond to such rubbish. An emulator that CAN'T even boot to TOS is hardly what I'd call the soul of Atari either.

My CT60 uses Patched TOS? Oh shit, my falcon isn't a "real" Atari anymore!

Hrmm.. Also I am from the USA, not the UK. And my Falcon sits on the cold
concrete basement floor. So it's probably a bit colder because of that.
Point is, the only thing that really affects the temp of the processor is
the ambient temp of the room. That's a cold running processor!

Hi,

> I would like to see the results of a 100Mhz LC against a 66Mhz FULL, if it
> can be done I know which I think will be faster!

The LC contains a PMMU, but no FPU. So, for integer stuff, the 100Mhz
LC will ofcourse be faster than a 66Mhz full, but the FPU of the full
version is incredibly fast compared to the FPU in the 040 and the
68882...

Have a look at the source below. Both routines are used for fixed
point calculations, but it is actually faster to use the FPU even in
this case.

Extract from Amiga DOOM:

Anyway, I wrote the ifusion author back when it came out to try and solve
the dcc problem, never ever mentioned open source, or even asked for source
or anything of the sort. I just offered to help solve the dcc problem,
and I got no reply whatsoever. I think I sent a second mail some weeks
later, no reply again.

Bus speeders (20, 25Mhz) will cause pixel errors on Videl, they will also cause missed pixels in Blitter copies. Have you tried with an Atari 4Mb board or better 14Mb board, what board are you using for ST-Ram?

Elliot.

Does DOOM use the FPU then? (I guess so).

But Magic and most of the apps I use do not use an FPU, surely it would run faster then? To be honst I probably will not be uping the Mhz anyway, it is just a thought.

Thanks

OK I have the disc in a external box connected to the SCSI port at the back
of the TT. This worked with a QUANTUN LPS340 (which has passive
termination).

I first power up the external IBM. it starts to spin slowly (low noise).
When I power up the TT the disc immediately accellerates to probably its
working speed (7200 RPM). (loud noice ;-)
The disc keeps spinning fast, even after I switch off the TT again.

I just received HDDRiver from Uwe, so I can try out your suggestions.

Hello!

> I suspect that the traffic is going to the default route (rtk0)
> my network card instead of ppp0 The message "default route already
> exists" suggests this to me.

Why do you set a default route if your intertet connection is a dialup
connection over ppp? This is wrong for sure.

> I just tried starting pppd, deleting the default
> route and entering:

It's better you don't set a default route at all or remove the default
route before you start ppp.

> route add default ppp0
>
> this is wrong, it just said:
>
> cannot add route: Network is unreachable.

Sure, your syntax is wrong:

route add ppp0 default gw <ip>

where <ip> is the ip of the default gateway, in your case it's the remote
address that pppd received (that's why it's best to let pppd setup the
default route).

Ciao
...Frank

Yes, this really is going nowhere. It shows why these discussions always
end up in crap; it's because certain people argue for the sake of it,
instead of trying to coming up with logic in order to establish some
sensible viewpoint. They first assume X sucks (whether X is an OS, an
Atari-derived computer or a person) and then will come up with any silly
argument that points in that way.

I'll stop reading these threads now, there's really no intellectual gain
that can be expected here. :)

Maurits.

I personally do not know of any. But Edith (freeware, now, I think) is good at patching files into one large file. Google Edith, should work. The latest versions are for Linux.

If you have sufficient memory, that may be the easiest thing to do. If you have a TTM195 monitor, it gets even easier.

The only thing that will put together multiple files that I know of is the original version of UUencode, and that takes files with the proper headers and footers.

> 12 led out not connected

Probably 5 should be ON (i.e. 1). State of 6 depends on physical layout of devices on the SCSI chain- is IBM disk at the end? If so, then 6 = ON correctly, but any other termination on other devices or the cable itself should be removed (seeing that the new disk causes problems with the previously installed one, I am inclined to think of improper termination, or maybe even a bad cable). Jumper 7 seems to be ON correctly (this caused problem to me with TOS2.06 while it was OFF). I am not familiar with effects of 8,9,10, but from their names they seem to be important as well, at least 8. State of jumper 11 should match capability of the controller in your machine, but ON (i.e. disabled) is probably correct.

Maybe this could be of some help as well:

1: Until I properly configured it, my IBM disk was not correctly recognized by the computer. I had to additionally reset the computer to get everything working properly. Of course, this is not an acceptable option for everyday work, but might be of help to determine whether the disk is ok.

2: Even now various disk formatting/partitioning utilities (e.g. AHDI, ICD, Hushi...) utilities obtain various results when trying to notice my IBM disk. Sometimes a repeated SCSI scan results in recognition while the first one does not. Also, for some reason, some of them (I think Hushi) could not recognize it when searching was enabled for other SCSI-IDs past the IBM's one. This all probably sounds rather horrifying, but amazingly all those drivers normally recognize the disk at bootup and it works very reliably. I don't know why is it that -only- bus-scan programs and the said formatting utilities have problems. Possibly it even has nothing

to do with the disk but with the controller/adapter (a Ge-Soft, one, I don't remember the model).

cu;

Yes and NOONE is suggesting otherwise,
but what do you hope to gain by doing it in this way?

I am telling you, you're coming off as a really rude person by using
this approach. Why not just present the facts? You can still make it
perfectly obvious that you're mad as hell about how things turned out.
No need to talk about piece of "crap", "shit" or whatever. Clearly it
is not a FACT that Papyrus is a "piece of shit".

And if I get that kind of response, then I won't implement iConnect
support ever, and then Dennis can realize that maybe the authors should
have released specs and libs to begin with. But we'll see what happens
when I get to that bridge.

Hi Janez,

>>> "MagiC is a kiddie OS"
>>> "MagiC is for people who have no needs"
>>> "MagiC is only used by morons"
>
>Well i definately dont agree with that, and i also never said such
>things

Did I claim that you said them? Why do you take everything I write so
personal? I gave you just a "small" example of the things I've had to
read here over the years. I kept my trap shut long enough, it's pay back
time now, feeling sorry or apolizising is water under the bridge... the
damage has been done.

>In reply for being called names, dreamer, platform killer, moron,
>mother**** its easy to say to much or to fast... And u definately are
>quick on those... If u still claim, u call horse a horse, then im all
>those things (or most)...

I do call a horse a horse. If I think you are a moron, I'll say it right
in your face, I never did.... but you take everything personal. Fine,
but just think that MagiC users may also take some remarks personal. It's
like I said a couple of days ago: I'm serving you guys a cookie made from
the same dough as you been treating us (MagiC users) with for years...
You're old and wise enough to conclude something from this.

Cheers from Belgium
Dennis

Hi Janez,

>> Actually that was Steeve who started that, not Dennis.
>
>Okay, But Dennis realy feel to correct us the all time and didnt correct
>Steve's claims either....

Why would I need to correct Steve's so called claims? AFAIK he didn't claim anything. It was your buddy Lonny who goofed.... Steve merely commented on them. Don't tell me your short memory is on the blink as well !!!

>And Iconnect on MagicMAC uses underlying MACs inet stack and daemons.

Really? If I'd say you are spewing bullshit, you'll probably feel offended again?

>So Dennis actualy say that using MagicMAC and use MAC OS resources is good,
>he even even feel proud, but adopting any of such resources or drivers to
>Atari is bad and killing the scene...

Where and when have I said that? When I go online with MagiCMac no Mac inet stack or deamons are used at all... don't believe me? Try it out on one of your macs... disable anything on the Mac that has something to do with coms and see what happens... Stop spewing bullshit.

>There is just something wrong with that claim... And whats wrong is MiNT
>hatery: if Magic is run on MAC is good, if Magic use and rely on FOREIGN OS
>is good, if Magic also use FOREIGN OS resources and drivers is also good,
>but to use ONLY small parts (drivers) of FOREIGN resources on NATIVE OS is
>BAD! As long OS is called MiNT and not Magic.. Thats whole point.. I dont
>see other in Mac/Magic user blame MiNT and developers.....

You are either doing this on purpose or you are a complete idiot. I'll give you the benefit of doubt and presume it's on purpose...

>>be said for a lot of the Atari apps. If tomorrow someone announces a
>>060 or PowerPC upgrade for the TT, I'll be standing in front of the line
>>to get my hands on one, but until then I'll use MagiCMac.
>
>And i dont believe that. 060 clone gathering dust since Mac is faster? I
>dont see how much quicker if at all TT will be ,so it wont beat Mac in
>speed....

Believe whatever you like...
I happen to love the TT, choosing between putting the clone or the TT to

rest wasn't a choice at all. Nothing beats the real genuine hardware, ofcourse the TT is slower then the clone, but for apps that don't need speed it's perfect, if I do need to run apps that require speed, I'll use the Mac, which outruns that clone not twice, not ten but almost 20X...
What's so difficult to grasp about that concept? The TT has always been my computer by choice, but this is the year 2003. If I wanna watch a DivX film or convert a CD into MP3 the TT let's me down, and with that clone.... it's barely possible, in this particular case the right tool is MagiCMac, not a TT and not a clone.

>I have 2 Mac's none latest spec. I use then with Mac apps and also enjoy
>some games. Have MagicMAC on laptop, but i dont use it at all.

Thanks !!!
You're the second guy who bought MagiCMac and don't use it, it's because of people like you supporting it, the real users are more or less sure that the development will continue... thanks again.
BTW: there's a new version hitting the shops now, time to contribute and update ;-)

>Atari feeling is soo much more as GEM only, its non GEM apps, games,
>trackers, tos apps, there is a lot! And all that spirit is efectively
>killed by MagicMAC (not Magic, if anyone will feel urge to mix that!!)

Just name me ** one ** app that runs perfect under MagiC, and doesn't under MagiCMac. I put it to you that *everything* that runs on a TT under MagiC with the NOVA graphic card, runs on MagiCMac also.

>And i im perfectly aware, that all that cant be preserved, im aware that
>GEM apps etc benefit most from fast machines. But i just wont accept
>babbling about killing Atari spirit from MagicMAC/PC etc users.. I know
>many MagicMAC users, clone users.. and VERY VERY litle of then actualy
>babble about killing the spirit with MiNT or with fact we use Ataris still.

You can only "enjoy" the Atari spirit on a genuine Atari computer, people using emulators or virtual machines like Aranym, are able to run 90% of the serious Atari software but the spirit is missing, I fully agree... but while trying to be nice to your companions you forgot to mention that on the clones there's no atari spirit either... MagiCMac or the clone, for me these two are simply ways to get a task done, but they are both miles away from even coming close to that famous Atari spirit.
And just like you I value that "spirit", and that's one of the main reasons why we're discussing for almost two months on end now. I want to see that spirit preserved, you and some others here don't seem to care that the "spirit" is being raped... and no it's not MiNT who's the rapist, it's the ported crap that abuses the spirit.
I wasn't babbling about killing the Atari spirit at all, I made it very clear that the TT is my preferred computer and that both the clone and the Mac with MagiCMac lack that spirit. You just don't want to read it, you have now stooped down to Lonny his level, congratulations...

Cheers from Belgium
Dennis

You agree? Based on what?
Because I've got conflicting views and don't lick Lonny his ****, like many do here?

>Imho most Magic users and developers are tolerant. Maybe tolerant
>is wrong word, i actualy dont tolerate Magic, im happy it exist! Its just
>my bad english...

Good, now you've got that off your chest. It's time to finally grasp that this whole issue hasn't got anything to do with Magic vs MiNT. Like allways threads like these are turned and twisted into the OS-Wars. I've walked on eggshells two months ago not to start an issue like this again, but alas it wasn't to be...
It all started when I wrote that I was fed up of the dreamers dreaming up stuff for other dreamers and that it was time that they produced something or shut the hell up. Before I knew it, we were back at the same game,

>Magic is their choice, i wont question their choices and i respect that.

Come again? Lets's blame it on your bad english...
I presume you wanted to say: "I wont question their choices, as long as they keep quiet about it and hide under that rock". You've shown that you don't respect someone his choice. Even in this post you show it again. As long as you can't pronounce that it doesn't make one single bit difference to you with what OS and on what setup someone does his thing, you have no right to say you respect people their choice.

>And to be clear: i dont have any troubles with MagicMAC/PC users. Or clone
>users. We have different views on clone/atari thing, but i doubt our
>arguing ever went overboard or became insulting...

Well, I'm a clone, a MagiCMac and A genuine Atari user and you have troubles with me. In view of this your statement is... It all comes down to one keeping his mouth shut doesn't it? If there is no discussion at all, then there's litte chance of an argument either.
If opposing and/or conflicting views are never aired then we can all go on

the way we did, and you can tell yourself that everything is just hunky dory in Atari-land.... well, I'm sorry to break the news to you, but it isn't.

>I will and did
>say, Milan is for me boring machine, it lack those aspect of Atari feeling
>i hapen to love. Same for MagicMAC: i just love nongem etc things a lot, so
>GEM only clone is not to nice option for me, but its still an option! And a
>lot beter one as PC/Mac and emulators still...

I said the same thing, but didn't get any applause for it, on the contrary, all of a sudden I'm a Mac user now... We've reached the stage now where everything I write shouldn't be taken seriously anymore, since I'm not a real Atari user. You and the gang conveniently overlooked what I wrote about using the TT... all you saw were those hated letters: MagiCMac.

You write about respecting people their choice, while at the same time doing your utter best to shut me up. If for certain tasks the speed offered by a clone isn't good enough for me anymore so what? The clones are getting on a bit, they use superseded technology and just like the genuine Atari's they lack modern interfaces and drivers. Suppose I want to watch a DivX film with Aniplayer? Should I tell you at how many frames per second that film will crawl on the screen? Running Aniplayer under MagiCMac will allow me to watch it, and in the end that is all what counts. I've written it time and time again but you don't wanna know it: the used OS isn't an issue for me , I only care that I can do whatever it is I'm doing at a reasonable speed with the least of worries, if I can't do it on a clone, then I'll do it on an emulator or whatever it takes.
A couple of weeks ago I asked several times how long it takes on a clone to convert an audio CD into MP3.... no one "dared" to give the figures. And you know just as well as me why, a 68060 based computer can't cut it. Not in a reasonable time anyway.
And there are some other issues to consider as well: hardware is getting cheaper all the time, unfortunately that hardware can't be used on the genuine Atari's and clones because no USB or Firewire interfaces are available. Well, I can use enjoy all those goodies with MagiCMac. Why should I miss out on them? MagiCMac is just a tool that allows me to use everthing that's attached to the Mac, and it's a tool allowing me to use all that stuff with Atari apps, apps I happen to like working with. You're all talking about moving foreward, well IMO moving foreward means more then implementing some improvements to the OS, in the global picture the OS after all is only one component. I move on with the hardware as well, and we all do it at a certain point, otherwise we would still be sitting happily behind a 1040STF with no hard disk.

>I will also use this oportunity for excuse if i accidentaly or in anger
>insult some of Magic users/developers. It was unintentional and i am sorry
>for that!!

Let's bomb them first, when we've flattened them we'll give then some sweets and say how sorry we are.... sounds familiar?
You've just managed to insult everyone who for whatever reason choose or was forced to use an emulator. But pay back time is getting closer all the time

Janez. I'm just waiting until one of you guys come telling us the advantages
of using MiNT under Aranym on a PC... then we'll have a real ball !!
And don't worry Lonny, I'll mark the releveant posts in my giant msg base...

Cheers from Belgium
Dennis

Hi Florent,

>Somebody would know it where I can recover driver GDPS for scanners
>EPSON GTxxxx. I could see on Internet which it was present on a ci¿½di¿½rom
>Crawly Crypt under name EP_GDPS1.ZIP but as I do not have thoseï¿½ Thank
>you for your assistance.

It'll be of little use to you... the program doesn't work on a Falcon, it
only works on the TT, Hades and a Milan with SCSI card...
Also note that the version on the Crawley Crypt CD is a fairly outdated one
with lots of features missing.

For your Epson GT6500 with parallel port I advice to go hunt after the
following apps:

Studio Scan (French program)
TMS Scan Design (German program)

These two commercial apps allow to scan from the parallel, serial with
adaptor and SCSI port. Note also that Epson GDPS only works with Epson SCSI
scanners.

Cheers from Belgium
Dennis

>> genuine Atari.

I don't care if you sleep with your TT, you ranted about moving forward, and
20x speed. I and others, can only conclude that the mac is indeed your
main computer. So go ahead and attempt to back step if you like, it's just
like you. So anymore persons and/or groups you wish to offend? Now that
you just put down all clone developers and clone owners. Last I checked my
hades didn't boot macos and it's hardware built specifically to run TOS. In
fact that comment is utterly retarded, as if an apple is anything closer to
a real Atari. Fire up Opera, on my web page is may equipment in detail,
pictures even.

6051. Tower preparation for CT60, Eiffel

Newsgroup: comp.sys.atari.st
Date: 2003-08-28 23:36:16 UTC
From: wmartz@firstpresdalton.org
Message-ID: <2f399fc7.0308281536.68eff51@posting.google.com>
Source record: 24126

Back in Feb 13th, Galan started a thread re; putting a falcon in a tower for his CT60. For some reason, it's not accessable, so I'm bringing it up again.
1 question was about what to do for a mouse and keyboard. The Eiffel seems to be the best solution if you're gonna use PC stuff. Does anyone know where I can get one? I don't want to try it myself. I'm in the US, but I'll buy "across the pond" if nessesary!
Another question he had was whether a Falcon MB could be mounted flush with the back of the PC case so that the ports are directly accessable. That's what I'd rather do to! When looking at the site by LAFABRIE Florent, I noticed that his CT2B installation seemed to be just so! Look at
http://perso.club-internet.fr/lafabrie/Atari/Centurbo/Index.htm

about the 3rd picture down shows the back.

In the previously mentioned thread, I asked about a cart port extender, as I didn't want my cartmaster lite to be inaccessable, so I got something from steve at Wizztronics that I hope will do the trick.

Too bad, it kind of makes it hard for the those who wish to keep
conversations constructive and at a grown-up level.

Again, and again, and again: everybody would gain from a
peaceful/grownup/nonhostile/whatever approach. Unless of course the aim
is to get bad vibes going.

6054. -=[Vintage Computer Marketplace]=-

Newsgroup: comp.sys.atari.st
Date: 2003-08-29 05:38:55 UTC
From: Sellam Ismail <sellam@vintage.org>
Message-ID: <PFB3b.290164$Ho3.41653@sccrnsc03>
Source record: 24128

The Vintage Computer Festival is proud to announce the grand opening of the Vintage Computer Marketplace, THE place on the web to buy, sell and trade vintage computers!

http://marketplace.vintage.org

The Vintage Computer Marketplace (VCM) has been designed to cater specifically to the vintage computer collector. The site features innovative sale and auction tools as well as inventory tools that allow you to keep a database of your computer collection online. It also features a powerful search tool to guarantee you find exactly what you're looking for. No more searches that return dozens or even hundreds of irrelevant hits.

At the VCM, you can Buy and Sell using standard fixed price and auction mechanisms. But we also feature innovative sale and auction mechanisms you won't find anywhere else, plus the ability to trade or even put items in your collection up for temporary loan.

Our powerful inventory feature allows you to maintain a database of your entire collection, including hardware, software, documentation, books, magazines, even ephemera such as posters, buttons, t-shirts, etc., in one centralized location. Our input forms are intuitive and easy to use. Once your collection is entered into the database, selling or trading off items to other collectors is a breeze. Even the database record gets transfered, so no additional data entry will be required, and a line of provenance is automatically created. The VCM really takes computer collecting to the next level!

The VCM offers one of the most powerful search engines on the web. Instead of putting in your search terms and then sifting through perhaps dozens or even hundreds of irrelevant links, you can target your search to exactly the make and model of the item you are looking for. We've pre-programmed hundreds of computer manufactures and thousands of models into our database, and are constantly updating it with new information. When you do a search on the VCM, you'll always find what you're looking for immediately.

During our grand opening period, the VCM will be free to use for an initial period of 6 weeks. After that time, the service will still be free to use for most users. Visit the VCM website and click on the "Help" link for more information.

The Vintage Computer Marketplace awaits your visit. Sign up now. It's FREE!

6056. [UPD] September Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-08-29 11:15:19 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3F4F35C7.3020805@lutece.net>
Source record: 24130

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka309.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

Some work has been done during holidays. The Lite
Edition now works on MagiCMac, but furthermore, it is
compiled with PCGEM and PCTOS libraries, designed
by Martin Elsï¿½sser for PURE C.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12

Note that GT-LOOK (now freeware) also works well with Epson scanners. I
have a GT-8500 that runs well with my TT (don't know about Falcon) on
SCSI.

GT-LOOK claims to work on parallel port as well and I have an adaptor
with an extra serial connector attached that should make this possible.

I have not tried the parallel connection yet, partly because I have no
manual for GT-LOOK. Anyone who might have a scanned version of this
manual?

Should not be impossible as I guess most GT-LOOK owners also own a
scanner :-)

As I said earlier, when my Milan is at home I use an ADSL
broadband router. I don't really want to break that set-up
while getting the dial-up working. At the moment I am using Sting
for dial-up but I would like to avoid having to install Sting
when I want to dial.

I have only just got pppd to run and I was amazed that it connected.
(I must have got something right ;-) I don't yet know how to get
pppd to set the default route, I have just been starting it from
the toswin using 'pppd'

That is very unfortunate of course but J.Koneckzny happens to be one of those rather unresponsive programmers I mentioned. He doesn't understand English at all, so unless you contact him in his native language, there's no chance of getting a response back, and even if you write in German, the chances of receiving a successfull reply back are minimal... I remember when Derryck and me were busy translating some of his apps, we had quite some trouble getting in touch with him not to mention staying touch.... if it wasn't because some people at ASH probably told him to talk to us, we would still be waiting. But then of course it's also possible that he wasn't interested at all in trying to solve that dcc problem... he after all wrote Chatter.

The other *very* unresponsive programmer in case anyone wonders is A.Diedering, getting him to reply is like trying to get water out of a stone :-(

Cheers from Belgium

>SCSI.

I know, but Florent mentioned in his original post that he already has this program, he wanted the Epson gdps_sc app because it uses the GDPS protocol, unfortunately that app doesn't work on the Falcon. The two other apps I've mentioned don't use the GDPS protocol either, but they do have a range of features which GT-Look lacks. Especially Studio Scan was ahead of its time.

>GT-LOOK claims to work on parallel port as well and I have an adaptor
>with an extra serial connector attached that should make this possible.

It does... my first scanner was a Epson GT-4000 which used that combination also, but it's a lot slower then when connected to the SCSI port.

While we're on the subject Epson scanners:
TT, Hades and Milan with a SCSI card users might be interested to know that the Epson 1640SU scanner (SCSI/USB interface) which is still in production works without any problems at all with the Epson gdps_sc program, for some reason however GT-Look doesn't want to know about it... so anyone who needs a new scanner, at least there is one driver left on this platform that can drive one of the latest scanners...

Cheers from Belgium

Hi Yves,

>I was use to see the German forum de.comp.sys.atari to be prolific, but saw
>only a couple of messages for last weeks : were are our German freaks ?

Try the maus groups...

maus.computer.atari.hardware
maus.computer.atari.talk
maus.computer.atari.dtp
maus.computer.atari.falcon
maus.computer.atari.software
maus.computer.atari.internet
maus.computer.atari.spiele
maus.computer.atari.mint_mtos
etc...

That lot can keep you busy a couple of hours a day...

On the maus groups there is a certain etiquette, they don't appreciate posting
in non-German very much, and they're not to wild about people posting with fake

email addresses, so don't say you weren't warned ;-)

Cheers from Belgium
Dennis

>: Are there any decompression programs that will unzip files that are
>: spanned across multiple floppies? Thanks.

Actually, there are a couple of utilities out there that can concatenate all the pieces and write one outfile. My personal favourite is SCHNIP & SCHNAP, written in 1996 by Fred Nicklisch, the program is freeware. SCHNIP is used to cut files up and SCHNAP is used to restore files. Before SCHNAP attempts to restore a file which wasn't cut up by SCHNIP, it asks to insert all the different pieces of the cut up file, scans them, and has an almost 95% success rate. The archive also contains a cut down in features CLI...
If anyone wants a copy of the app, mail me...

Cheers from Belgium
Dennis

From: ekaljuma@mtsac.edu (Galen)
Date: 27 Aug 2003 16:34:55 -0700

Hi Galen,

>I'm a bit confused by the last. Didn't all Mach64 cards have 1 or 2 Mb of
>VRAM?

The cards with VRAM were only available with 2 and 4Mb, and they used to cost
a small fortune. IIRC ComputerInsel referred to these as SuperPlus Nova cards.
They also offered Super Nova cards which came with the same memory but were a
little slower... The Mach32 cards was available in 1 or 2Mb and was referred
to as VME/MegaST Nova Plus card. ATI also produced Mach32 cards with 4MB but
AFAIK Computer Insel never used these.

>mailer, so you have no leg to stand on with such a comment anyway. I'm
>guessing you are using os9, as OSX is unix based and so very scary. lol

Yep just like you I'm forced to use a non-Atari browser. I don't use a mac mailer because the one I'm using right now is just as good. And for that very same reason I don't use a mac dtp, word processing, spreadsheet, graphics application and a whole bunch of other stuff either. If I can do it on Atari, I will, if it can't be done on the genuine hardware I'll do it under MagiCMac, and if that still isn't a solution, only then... I'll have a look around to see what is available for the mac.
But you're right about one thing: I do indeed use OS9, OSX isn't used here at all. And so far I haven't missed it at all either... just like those other estimated 15 million other OS9 users.
15 million morons.... I wouldn't wanna feed them, but if I was a programmer I would know who to support.

Cheers from Belgium
Dennis

Hi,

Depends how they were splitted, u could also try "CAT" command from MiNT,
in mupfel shell maybe. "cat filename.z*>archive.zip" should do it, if file
was just splited. There is also GEM app, called spliter or xsplitter....

Oh yes, it has! I'd say the CT60 has a lot more soul than hardware Atari
itself built. Rodolphe rocks, he is a genious. Fredi Aschwanden is another
dude which has my complete and uttermost respect :-) They made hardware
for our operating systems. I thank god they live!

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 08-24-03

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM.
Unit comes with mouse, power supply, floppy drive, and manuals
all in the original boxes!
$50.00

Atari SC1224 Color Monitor.
$30.00

Atari SM124 Mono Monitor.
$30.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor
$250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$25.00

Syquest 44 Meg Cartridges. These will be Atari HDX formatted

with no bad sectors.
$10.00

Syquest EZ-135 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

Syquest EZ-230 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

SC 1224 monitor cover by Classic Covers. This is a brown cover
with the Fuji logo and underneath "Atari SC 1224 Color Monitor".
Perfect to protect your monitor from dust and have it look cool
too.
$5.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk
$5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk
$5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks.
$5.00

Decimal Dungeon by Unicorn Software. An education program for

5th graders to Junior High. Uses a variety of decimal related math problems to help you escape the evil dungeon and caves. Color or mono. Box, docs, disks.
$5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room castle in this huge adventure game. Comes on 5 floppies. Comes with box, docs, and disks $10.00

Magical Math by Atari. The scholastic series math tutor program starring Bentley Bear. Box, Docs, Disk
$5.00

Mickey Mouse The Computer Game by Gremlin. Help Mickey rescue Merlin's Magic Wand in the enchanted Disney Castle.
Box, docs, disk.
$5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks.
$5.00

Plan 9 From Outer Space by Gremlin. Complete with box, docs, and disks.
$5.00

Planetarium by Atari. The scholastic series observitory in your own house. One of the better if not best scholastic programs by Atari. Comes with box, docs, and disk.
$5.00

Quartet Gold by Red Rat Software. 4 games in this box, Pengy, Cosmos, Screaming Wings, The Secret of Steel. Pengo clone, Galaxian Clone, 1942 Clone, and a graphical adventure.
Box, docs, disks.
$5.00

Renegade by Mastertronic. A Star Raiders type space shooter type game. Manual and disk.
$4.00

S.D.I. by Mindscape. Complete with box, docs, and disks.
$5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks
$5.00

Spelling Bee by Atari. The scholastic series spelling program for kids. Comes with box, docs, and disks.
$5.00

Their Finest Hour by LucasFilm Games. The Battle of Britain
flight sim. Box, docs, and disks.
$10.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks.
$15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk
$5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$30.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk.
$3.00

Geneva by Gribnif Software. A mulitasking operating system for
the ST/TT/Falcon. Now run more than one application at a time
and have up to 256 windows open at a time. Best thing is Geneva
is very fast and stable. Box, docs, disks.
$15.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk
$5.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.

This is a boxed Atari version and not the pack in with the Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

PrintMaster Plus by Unison World. The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs
$5.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk
$3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk
$5.00

STraTOS2 CD. This is a CD Magazine covering the Atari line of
computers.
It is dated 1997 and is mostly in French but many of the programs are
in English. It covers and contains software for MINT, Linux, Games
including DOOM, Internet and more. It has a program that runs the
magazine
and gets you to the software for automatic installation
$10.00

Thunder by Batteries Included. Sophisticated writing tools including
spell checker, speed-typing word expander & corrector, and statistics
on your document like the number or words, lines and more.
Manual and disk
$5.00

Time Link by Batteries Included. A time management software package.
Keep track of appointments and see them by the day, week, month,
or year. Manual and disk.
$5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair
progarms that were infected. Manual and disk
$5.00

Universal Item Selector III by AD&D Software. Full Utility functions
from your item selector. Besides adding much need funtionality to TOS's

item selector you get to see available RAM, format floppies, print
directories
set file paths, set file attributes and much more. Docs and disk

$5.00

WANTED

MagiC Mac Ver 6.XX or MagiCMac OSX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms

I also have lists of software for other platforms like IBM DOS or
Windows,
OS/2, Mac, BeOS, NeXT, and Amiga. If interested please request a list.

I'm having a clear out of my loft and have the following magazines I need to clear.

ST Format - 32 issues 1990 - 1994
ST Review - 15 issues 1992 - 1994
ST User - 21 issues 1991 - 1994

Sorry there aren't any cover discs, I gave those with my ST.

I live in Luton, Beds, UK.

These are free for anybody to collect, or I can deliver locally for a couple of beers :-)

Cheers.

I'm listening. Ok, MagiC loads faster, np. for me, I reload my system very raerly. In most cases only once per session. And no, 2, 3 secs does not matter.

What matters? Put 5000+ files into one directory and try to view it. Thats matters.

Nor am I convinced. If you have an 030 or better Magic has no advantage that I can see. I have used a full KGMD installation with an AES for some years on a TT and never found it to slow to do what I needed to do. In fact it has disadvantages, magic would not let me network my TT into my lan.

Got it working :-)

By deleting the default route (route del default) and starting
pppd with the 'defaultroute' option.

I think this may be a bit unconventional so I will try to improve
it a bit.

Hopefully I haven't broken the Broadband, ethernet set-up.

Thanks for the tips.

Peter

It *might* be possible, that there is something of use within SDL (http:/
www.libsdl.org) or one of its support libraries. One of the extra modules
adds support for extra file formats.

6090. EJP nightmares - please help, somebody!

Newsgroup: comp.sys.atari.st
Date: 2003-08-30 19:40:30 UTC
From: Tom McEwan <captaininsanity@ONAYAMSPAYuk2.co.uk>
Message-ID: <biqukaaka1@newsg3.svr.pol.co.uk>
Source record: 24070

Some of you guys may remember me trying to build a homemade Jag pad for my STE a while back, and having some difficulty getting it to work. Well, after finally biting the bullet, opening the computer's case and poking around with a logic probe and oscilloscope for hours, I'm now fairly convinced the Atari itself is faulty.

Having spent a whole day searching, I finally found the official schematics for the STE, and tracked down the chips involved with the enhanced joystick ports. The fault with the joypad is that only buttons A, B, C and Pause are being registered by the two games I have that use the enhanced ports (Zero-5 and Substation), and all other buttons have no effect. Given that both games have exactly the same fault, that pretty much rules out software errors too.

Checking the circuit diagrams of the computer motherboard, it appeared obvious which chip was faulty - all the working input lines were handled by one buffer chip (U509), and the faulty ones by another (U512), which I therefore expected to be blown somehow (I think this machine was originally a display model, so it probably got a lot of rough treatment). However I then replaced the suspected faulty chip with an identical replacement, ie a 74LS244, and nothing changed. Checking with a scope, it appeared that all data presented to U512 was having the desired effect on the output pins when the chip was enabled. This is pretty weird, because after these chips the signals seem to go straight onto the main data bus of the machine, and if there was any kind of problem with that, nothing else would be working either. So basically, I've no idea where else the problem can be (It's definitely inside the STE, though - I've tried simulating pad buttons by manually connecting wires across the various chip terminals, bypassing the port altogether, and the problem remained).

Has anyone out there experienced a similar problem, or any idea at all about what the hell is going on with this thing? Please??

Tom

Glenn.

The best way to exchange data between an Amiga and an Atari is the
DOS-format. Amigas can read and write DOS if they are equipped with OS
3.0 (or eben 2.0???) or higher using CrossDOS. Ataris can read and
write DOS-disks if you are using a TOS that is not too old.
I went this way for years and it worked great.

6107. STinG scripts for Tesco.net?

Newsgroup: comp.sys.atari.st
Date: 2003-08-31 17:24:40 UTC
From: sonik@whsmithnet.co.uk
Message-ID: <sbq4b.316$hE6.385738@newsfep1-win.server.ntli.net>
Source record: 24087

Hi folks

As an online Atarian, I am keen to access my mail etc from either my STE 1040 or my PC and have been able to do so until recently via a pay-as-you-go account I had with Freeserve (my Atari was unable to access my usual paid-up WH Smith account). However, I think Freeserve have called time on that PAYG service as the number no longer connects.

Is there a dial script available for STinG for Tesco.net, my new ISP? Is there any site where I can download a template one so I can add my details? I seem to remember one for an early provider of mine, Zetnet.

Cheers
Al

Hi all!

Further to my last message on this subject, I tried all four variants:

richard.kurz@un.maus.de
richard.kurz@UN.maus.de
richard_kurz@un.maus.de
richard_kurz@UN.maus.de

but all were rejected at my ISP with messages like:

QUOTE
----- The following addresses had permanent fatal errors -----
richard.kurz@UN.maus.de
(reason: 550 Host unknown)

----- Transcript of session follows -----
550 5.1.2 richard.kurz@UN.maus.de... Host unknown (Name server: un.maus.de: host not found)
UNQUOTE

[Interesting that the domain does not seem to be case sensitive,
since this one was sent with UN but Host unknown has un !]

So does anyone have his current address please? And can I beg one
of our German readers to post this query in the maus Atari groups
please? Ta!

The freeserve web page still lists anytime as being available. I am sure
there used to be two numbers but they
now only list 0845 079 6699 as the number. Also has your account expired?
If you don't use it for 90 days you need to do "Retrieve account" from the
freeserve home page. (top left, internet access panel)

Hi Pierre,
Note that this is all under single TOS 4.04 on a Falcon.

MEG looks like a nice program! A bit buggy though :) I have the "b"
version. It doesn't save the mailbox info and if the mailbox info is wrong
then it freezes the computer after attempting to check the mail. If the
mailbox info is ok then it checks for mail ok. It also doesn't launch the
news client.
After this is all corrected :) is it possible for it to run in the
background while doing other things.
Suggestion: A standard ASCII text file (not HYP) with your E-mail
address in the package would be helpful for bug reports.

Regards,
John

>No they cant be read, Amigo used some variable speed system,

The Macs were the ones that used the variable speed drives. The Amigas,
on the other hand, had (still have?) the CPUs do all hard work since
they don't have a disc controller to do it for them.

>only good for playing tunes on?.

Not really, although they do "tick" quite often if there's no disc in
the drive.

So am I, and bugs can be cured like you say... but I've been waiting for
some odd 6 years now, to see some of these bugs being fixed. The authors
either don't care or can't fix them at all...

Cheers from Belgium
Dennis

Bonjour :)

> Note that this is all under single TOS 4.04 on a Falcon.

Meg is suited for multitasking environment such as MagiC. I wonder how you can run it 'while doing other things'. Note that you have to declare the email-client in the preferences and it can be launched only in multitasking mode (same thing about the log file and sound).

The environement variable HOME has to be there to retrieve the user preferences (and paths of small Meg's databases). If not, the INF file is located/taken next the PRG file.

> It doesn't save the mailbox info

Have you saved it with Control+S, or via the menu ?

> and if the mailbox info is wrong
> then it freezes the computer after attempting to check the mail.

Normal : 'resolving' the server that contains your mailbox. If if can't be found on the internet, the timeout is 30 seconds to exit. (STinG / STiK -> use escape to abort resolving ?)

> Suggestion: A standard ASCII text file (not HYP) with your E-mail
> address in the package would be helpful for bug reports.

Good suggestion, thanks :)

IMPORTANT : I suspect another bug (confuse 'Reply-To' and To'), so do not use "To + Cc is not for me" filter !

Au revoir

Rajah

> account I had with Freeserve

A fellow club memner reported that he wasn't able to connect to Freeserve with STiNG any longer - they claimed though that nothing had changed in their login.

> Is there a dial script available for STinG for Tesco.net, my new ISP?

Don't get hung up about scripts. Try the default cfg file with your details added but don't bother adding anything into the dial.scr section. It's been a while since I've done this, but there's usually no need to enter anything in that section unless you really have to and the way to find out what to add is to log in using a terminal prog and make notes on what it's asking and what you have to respond with.

ok. I had Magic running a while ago but had trouble with it and
certain programs wouldn't run under it so I stayed with single TOS.

It doesn't seem that ROM can fix bugs, although you'd think they would considering the price they charged for this Sarz infected crap that they passed off as papyrus. You'd think that as it was so utterly useless that they'd provide a free bug fixed copy to all their extortionate-fee paying customers just to say 'sorry we bent you over on this one'.

Don't customers have opinions where you come from?, does your regime censor your thoughts when it comes to calling a spade a spade?, are the thought police gonna track you down for speaking to me.

The last Papyrus issue was complete shitte, people who paid for this crap should get the latest version completely free IMO.

As for attitude, how would yours be if you'd paid almost a weeks pay for something that was badly translated, full of bugs and offered less functionality than its predecessor.

Hi Adam,

>What matters? Put 5000+ files into one directory and try to view it. Thats
>matters.

I agree... and that's why I use FAT32 partitions under MagiC, trying to view
those 5000 files is dead easy. One opens a directory, and there they are,
whizzing by in full glory... MiNT isn't the only OS who can use a different
and faster partion scheme...

>Dennis dont throw updates of an emulator in my face, tell me about Atari
>Magic update. I do NOT wanna buy Mac to be able to use newest update of an
>ATARI OS, thats ABSURD.

I don't throw anthing in your face.... but like usual you don't read what is
written. I've said that the English MagiC was updated, I didn't mention an
emulator at all....

>And about MiNT updates, im really happy u mentioned that, obviously u didnt
>care to look on pages i suggested, so ill help you:
<snipped>

I don't need to look at these.... where can I download that famous version?
AFAIK the latest OFFICIAL version, for general users is getting on quite a
bit.

>>I know it sounds silly but it's like nothing ever appears from that corner
>>of the world... not the kind of apps that you mentioned, if we're talking
>>about CLI or OS-specific stuff then it's different of course.
>
>Really? Atack Mail, Atack Ftp, AtariIRC, EmuXL, GGT2. And prolly a lot
>more, since we realy cant say what OS authors use.. Many coders use
>singletos for coding anyway.... And they are all GEM apps, not Magic apps
>or MiNT apps... i dont know what u wana push ans prove here....

Gee... 5 apps and a bit!!
Put the 5000 odd apps against these that were programmed by Tos and MagiC
users, call me anything you like but as long as nothing essential comes from
your part of the woods I'll keep repeating that the MiNT community makes a lot of

noise without anything to show.

>>Yep, Thing is shareware, I have no clue why this is an issue so I'm not
>>going to comment on it. But be realistic, how can you claim an easy all in
>>install when the package contains no desktop?
>
>Find me my message, where i claimed its easy, and not noted obvious
>problems or catches? And where i didnt offer help? I always agreed or
>warned ppl with possible problems....

There is no such message, you are one of the exceptions that admits that setting up a full blown MiNT takes more then just unpacking the archive. You offering help is nice of course, but its not the ideal situation. The ideal situation should be that people don't need to ask help at all...

>And at this point ill stop... U acting insulting and patronising, answering
>my claims i didnt say. I can not prove ONE point here, u all twist ALL out
>so why the heck ill loosing my nerves and time here. U dont mean nothing to
>me, enjoy tortuing other ppl's RSC's, bitching on coders or MiNTers i dont
>give a shit anymore.

You've called me a MASTER in twisting words, according to you I'm also the best when it comes down to selective quoting, so why are you surprised? I'm only showing that I'm a true master at this game. I've learned a lot in CSAST the last couple of years...

>You think so high of yourself, but i remind u, translation is not
>creation...

I know Janez...

>Do not forget that. U may translate Einsteins relative theory to Klingon if u
>wish, that wont make a physicist out of you. And u add to scene aproximately
>that much... A bit of balast

Don't worry, I won't put anymore "ballast" onto your scene anymore. The first person who dares to ask me for translated sources, beta's, docs etc.. will be referred to the MiNT community... that is your scene isn't it?

Cheers from Belgium

WO!!, fuck me i almost expressed an opinion, what a travesty.

Tell me, did you spend a packet of money on something that turned out to be
shit, i did, i bought papyrus, and as such I'm entitled to this fare-paid
opinion whether you like it or not, i paid for this privilege. Did you buy
it or are you just opening your arsehole for exercise?.

But may with a little luck be easy to repair...

Sounds like a classic case of bad contact on some IC's. The fix is to
press down all the chips firmly in there sockets.

The Eiffel does not seem to be available at the moment. I have had a
few chips programmed, but have not (yet) built the board since I
revived a dead Deka board and am hoping that Lyndon will post updated
schematics that allow for joystick & mouse connectors to the Eiffel.

> Another question he had was whether a Falcon MB could be mounted flush
> with the back of the PC case so that the ports are directly
> accessable. That's what I'd rather do to!

It is possible. Besides having to move the power supply, you will
have to cut the narrow rectangle to size from the back and possibly
reinforce the case. You need a pretty big case though, since you have
to suspend the falcon's board above the bottom so that you can access
the left-hand side's ports. I didn't have a desk large enough for
that, so I chose another approach.
>
> In the previously mentioned thread, I asked about a cart port
> extender, as I didn't want my cartmaster lite to be inaccessable, so I

It should work fine -- note however that the shorter the lines, the
better.

It's not normal.

For a first attempt, try opening the case (there are a bunch of screws on the bottom), and access the motherboard. Ground yourself (touch something large and metal nearby) and press moderately on all socketed chips. They tend to loosen over time. If that doesn't work, you have some serious work to do.

I am simply suggesting that the way you expressed your opinion was unconcstructive
and in this case very disrespectful. Apart from that, I can sure understand
your problems. Trust me, I can. And opinions are allowed, but one can sure
choose bad as well as good ways of sharing them.

>As for attitude, how would yours be if you'd paid almost a weeks pay for
>something that was badly translated, full of bugs and offered less
>functionality than its predecessor.

That would of course not be good, and I would clearly be very unhappy about
it. But the way you let us know you're unhappy, made you look bad as well.
Better give people the full story, and skip the foul stuff.

It will better serve your purposes, I am quite sure.

If I were a Papyrus developer and received mails like this, I'd probably move them to the trash after reading the first paragraph.

> The last Papyrus issue was complete shitte, people who paid for this crap
> should get the latest version completely free IMO.

There are some bugs in Papyrus 9 but I enjoy using it very much. The concept of "paying for bugfixes" applies much more to a program like CAB than Papyrus. Now THAT was a waste of good money. :)

But let's try to get this discussion to a more sensible level.. could you give a rational explanation of the bugs you saw in 8 that were still in 9, and preferably without swearing? I'm asking just out of curiosity.. I admit Papyrus 9 isn't perfect but to me it's a major improvement over 8.

> As for attitude, how would yours be if you'd paid almost a weeks pay for
> something that was badly translated, full of bugs and offered less
> functionality than its predecessor.

I'd get into contact with the developer and try and sort things out in a sensible way. I've learned that this usually gets me a lot further than just trying to impress people with my anger.

This would all the more be the case if I paid for something that had less functionality than it's predecessor, but I never had this happen to me. Not even with CAB, let alone Papyrus.

Maurits.

Don't undo the screws below the internal floppy drive (if fitted),
they only hold the drive in place and have no effect on removing the
casing.

If an aplicationa was developed under Some-OS but runs under Some-other-OS and Some-even-other-OS, should we say it is Some-OS only?

Take tons of TOS software that run hapilly under FreeMiNT. 99% of them will run under MagiC too. Should we call them SingleTOS, FreeMiNT or MagiC apps?

FreeMiNT and MagiC (and even SingleTOS) share common API. This API is an extended version of SingleTOS API. As Andreas Kromke in his other post on this group said: he tried to mimick as much of MiNT API in MagiC, leaving only stuff that are not comonly used (and/or difficult to implement). In this context saying that some aplication belongs to only MiNT or only MagiC if a nonsense, as they are designed to be as close to each other as possible. Yes, they are some programs that run under one of those OSes and do not run under another - but they are very OS specific and they are no more then 1% of all programs.

This situation is not possible. For some users it will be always to hard. (no offence anyone - this is not my point, my point is that there are pople that are not good at any technical rhings and computers are like black magic for them).

(one thing: MiNT (nor MAgic) use partition schemes. They relay on hard disk driver with that, what they use are diffrent Filesystems)

Try Ext2 partitions and you will understand why we MiNTers do not like FAT32 ;-)

Actually they made it easy: There are screws in square holes and screws
in round holes. Only one of these two sets of screws holds the casing
together (I think it was the square screws, but I don't have an ST at
hand to check.. should be obvious though).

Maurits.

His file system of choice is the mac file system (ala magicmac), and as the author of Aniplayer pointed out that shields him from the sometimes fatal file locking problems magic has on real hardware.

He's not going to bother to test ext2, that requires installing and reading docs and or man pages. ;-)

ftp://ftp.funet.fi/pub/atari/mirror/wh58-508.st.uni-magdeburg.de/pub/sparemint/html/groups.html

But then of course you'll discard most applications as toys or useless,
whereas the 5000 odd apps programmed by Tos and Magic users (what does
that have to do with anything?) are of course all part of your daily
Atari use.

Maurits.

Hi Steve,

Can you mention some of these bugs? I've been
using Papyrus for more than 7 years now and have
never stumbled into any bug at all. Maybe you
use it in a specific way for a purpose. I am
very curious what that is and compare that with
my use of the programme.

Thanks in advance,

Raoul Teulings

I have an ENTIRE spectre setup, GCR, 128 2 floppy drives and cables, TONS of disks, MacOS, roms, etc that I can part with. For the whole thing I am thinking $100 but it's negotiable. I'm having trouble testing it though because I don't know what I'm doing, but I suspect it all works ;-)

> (like "got mail" or a bell)? &/or remame as ACC?

I can make it ACC easely for the next bugfix/update, but the some features
will always need a multitasking environment (AES > 3.99).
I do not know how to ring the bell, but i'll search ;p

> from your part of the woods I'll keep repeating that the MiNT community
> makes a lot of

Dennis u are pathetic... Do u really see all that as MiNT vs other clash? Do u realy think that author of XXX apps consider himself as part of MiNT or Magic comunity? U really think any author who use Magic aim app he does (most prolly code in singletos anyway) as Magic app, or that coder who use MiNT as his OS aim his app as MiNT app? I use MiNT OS, any app i did or intend to arent aimed to an specific OS, except the ATARI OS, same i can say for Lonny, and for probably all coders on MiNT or Magic or TOS. And now u here wanna make sides on base what OS coder use? Thats sad indeed....

When u will realise that we are in SAME boat. In this message of yours u again divided scene and blame exactly one group, MiNTers. I speak for myself: i use MiNT OS, and i like it a lot.. There all difference to some Magic user ends. When i did GGT2, as my only GEM app so far, i didnt target on MiNT nor Magoc, but GEM. Period. Im sure same goes to Lonny, Didier, Papyrus authors etc.... And to reply something u said earlier: i DONT bomb Magic users and then appologise, i never generalise them with u, i only hate attitude u have and always had a quarrel with you, never with "u guys" or "u and your pals" or "your woods"....

I'm not saying that ROM or Papyrus are perfect (well... what is?), but could you (and Dennis) tell me what better programs there are on the Atari platform as far as Word Processors/Databases that are *not limitted to German-speaking/reading users*, is capable of reading MS Word, and handling HTML fairly well? I personally haven't seen anything else, and while I've run into a bug or two in version 8.23, it is for the most part, a very tight program on my system, and worth every penny of its price (IMO, of course). If you can show me a better program, I'll check it out. Otherwise, I personally don't understand what all this Papyrus/ROM-bashing is all about. Seems kind of pointless to me (again, just my opinion).

Dear all,
thanks for your fruitful comments on my previous question, it really helped. Now I have a new problem. My Atari 520 STfm did manage to boot on couple of occations at first (the usual stuff, some "ticking" noise from empty internal floppy drive and green OS screen appears). But now, when I try to boot it up, the only thing I hear is the same usual "ticking" noise from the floppy drive which goes on forever (was waiting for over 30mins) but nothing happens, no green screen, no cherry bombs, nothing. I did try to boot up with floppy drive disconnected, didnt make any difference. Just was wondering what was going on, didnt have any luck in FAQ, so you guys is my last hope ;)

Moreover, when I did manage to boot up at first I was trying to format DD disk (3 to be precise) but failed every single time at around 80% format, OS was saying that there is some disk error. Not sure whether it is related to the above problem in any way.

My gear: Atari 520 STfm (internal floppy + modulator)
No internal Hard Drive and no other external/internal mods.
Just plain 520 STfm.

Thanks again,
Gil

In this country customers have the right to complain, and complaint volume
is acceptably related to the unacceptability of the product, besides, i
tried the civil approach but since they've already cashed my cheque they
aren't interested.

> > The last Papyrus issue was complete shitte, people who paid for this

I wouldn't know, my version of CAB was free due to the effort i put into
beta testing it. Besides that was a small amount of money compared to
papyrus.

> But let's try to get this discussion to a more sensible level.. could

Yes i could, and i did, direct to the developers, i even sent them answers
to the problems, i even solved most of the problems on my own application to
prove it could be done, and then notified ROM. I even fully translated my
version to prove it could be done!!.

> > As for attitude, how would yours be if you'd paid almost a weeks pay for

I have not actually used it for quite some while, having moved to Word under XP-Pro but I'm surprised you cant find any problems. I can't think of any of the top of my head, lets see...

There were major problems with Translation, bugs in dialogs, driver path problems system folder problems, bugged drivers, colour display problems in high resolutions (1024 * 768 @256colour)

That's all i can recall atm.

The eternal disk check on bootup sounds a lot like loose ROM chips to me. You can open up the case and straighten them out, maybe clean the contacts with some methylated spirit, or you could just try the controversial "Universal 10.16cm (4 inch) Drop". On a stock Atari, everyone swears it can do no harm, but given I've made some structural mods to minee (replacing the FD mount pillars to fit a larger drive, to be exact, cos some moron had glued the disk eject button in on the old one), so I haven't risked trying it on my machine.

As for the format problems, I'm not sure what could be wrong. First thing, make sure you're using genuine low density disks (they don't have the extra hole on the opposite side to the write protect tab). Atari's generally don't like HD disks. Next, make sure the drive itself is connected and working properly (you can take it out of the atari and test it by plugging it into a PC, though I have a feeling you need to turn the cable upside down or something strange like that) Other than that, I can't think of much else.

The poor choice of words probably translates to "doesn't function correctly under magic", thus it's automatically something wrong with Papyrus. Just a guess. ;-)

> aren't interested.

Ok. Still, you seem to want to convince us that Papyrus is crap, and in this case also your tone isn't helping you. Especially since other people here seem quite happy with it, and you don't want to tell us what exactly wrong with it.

> Besides that was a small amount of money compared to
> papyrus.

Yes, but Cab is unusable as a serious web browser and in that aspect WAY too expensive. Papyrus does what I want it to do, apart from some tiny glitches and is way better value for money.

Actually, the only annoyancy that comes to mind right now is the fact that the mouse clicks "through" the popup menus, ie if there is a button behind a pop-up menu, you'll accidentally press it when selecting an item. Or if the document window is behind the popup, you'll place the cursor under the mouse by clicking a pop-up item. But I got used to dragging popups instead of clicking them, that helps.

There's probably more but I don't even remember.

> Yes i could, and i did, direct to the developers, i even sent them answers

> version to prove it could be done!!.

Well if you want to keep it all a secret I'm afraid me and others will be fooled by ROM again and happily pay for the upgrade. :)

Regards,

Maurits.

You'd be quite wrong though ;-)

I know that Steve had severe problems with the Database section (remember, he was administering a Cub pack with it), there was a silly bug concerning folder names which bit if you were trying to add print modules (STFax), and some rather schoolboy errors concerning keyboard shortcuts in dialog boxes. I know that there were far more; these are the ones that I remember still.

These are the kinds of things that should have been weeded out as part of beta-testing or as part of consumer feedback.

I'm not surprised that Steve is angry.

Well, why not sell it or ebay it, or request a refund?
Would be more useful than such language.
I find it odd you have to explain Steve's problems, as he's been asked
and just keeps using the lower form of English. ;-)

But yeah I can understand the problem, I agree with others the methods
used to convey them don't, and won't help the problem at all.

Thanks Tom,
it helped! ROM chips did become loose, so pushing them down did do the
trick. After I've solved this problem, formatting problem has gone away,
nice. What do you need to do, for RAM chips not to get loose again?

It looks like you know what you're talking about (with all your mods,
etc). Where can I get new roms (with new OS, Ive got 1.2) at reasonable
price (im in the UK)?

Thanks again for all your help, much appreciated!

Amiga and Mac both use GCR as opposed to MFM 'formatting'. No, I can't
remember what the difference is, but for my STE to read a Mac disk I
have to use Spectre GCR, which has additional hardware for controlling
the disk drives.

Unless you specifically need the later TOS 1.04 roms the 1.02 will do most
of what you need.

Changing will be waste of money unless e.g. you want to use a hard drive.

On 31 Aug 2003 17:04:45 , GokMasE wrote:

>I'm glad to see some are still releasing commercial software packages
>for the Atari.

I'm always pleased to see more software coming out for the Atari. O.K., it might not be perfect, and if you've spent money on it you expect it to work well. But how many PC users are constantly disappointed by the bugs in their software, and then, after upgrading it and just as they hope it is working O.K., MS announces they won't support it any more. You are forced to upgrade even if you don't want to, or the features you bought it for won't work any more (e.g. I had to upgrade from IE 5 to 6 or I couldn't continue to access the secure sites). Soon no doubt, I will be encouraged to spend on another version of Windows as MS won't keep supporting 98.

It's a far from perfect world, but I find most of the Atari platform software I use gives me fewer problems, and far more pleasure than the Windows stuff. I include Papyrus in that. I use it a lot, both on the PC and the Hades, and find very few problems. (The only ones that bother me are on the Windows version !)

I paid a lot of money for Cubase Score. Steinberg never finally debugged it, and I wish they had, but it still runs better than Cubasis on the PC, and I can do a lot of work with it.

and while I'm here .....

I've ignored countless posts on this list in recent months and resisted the urge to comment on the many that have been offensive, both in language and content.

There can be no justification for swearing, using obscene language, and indulging in the personal insults that have been posted here. This list is not on an "adults only" server. I would not expect to have to close the window if a child comes into the room, and I do not wish to be embarrassed if my wife, or any other person come to that, should look over my shoulder while I am at the computer.

Please let's keep this as an Atari forum, dedicated to helping other people, not offending them.

Paul

>casing.

Yep. The ones to undo are those in square holes. After that you
will have take off the top of the case and then the keyboard
(lifts off after unplugging one lead - make a note just how the
plug fits the socket!) and remove the shielding; this is held in
place with screws and also twist-tabs all round.

Before you do this, try the famous 'drop test': Lift the machine
4 or 5 inches (OK - 10 or 12 cms!) above a hard surface and drop
it down on it. Often this will jar loose chips into place. If it
works (or even if it doesn't), *then* open up the case and try
reseating all the socketed chips.

I have an ES 800C scanner. The model number was different for Europe.
It has both parallel and SCSI ports, and I had better luck with the
parallel port than the SCSI port.

I never have had a manual for GT Look. :-(Even though I bought the
program too.

I have the disk and manual, or rather flyer. Not much to it, 3 or 4 folded pages. If ever you really need to know something about it, I could photocopy it.

do most
> of what you need.

The main advantages of TOS 1.04 over 1.02 is Control+Alt+Delete
keyborad reset and DOS compatable disk formatting, although the latter
is only of importance in doing PC to ST file transfers and even then
you can format the disk on a PC.
TOS 1.04 in the last TOS version that can be fitted directly to ST's,
if you want a higher version than that you will have to install an
upgrade board. IIRC these usually involve an external switch that
allows you to select either the original TOS version or TOS 2.06 as
necessary because some software may not fuction with one of the TOS
versions.

> Changing will be waste of money unless e.g. you want to use a hard
drive.

Although hard drive communication my prove slightly faster I'm not
sure you would notice the difference detween using a hard drive with
TOS 1.04 and TOS 1.02.

You need an address decoder for 2.06 on an STFM, you can also build a
switcher.
Tos 1.02 is 192k and 2.06 is 256k, so you need to address the extra space.

It is also to to with reliability, Tos 1.04 was less prone to data
corruption.

Source record: 23989

Hello,

I don't post a message for everything I port to Atari, so a brief message
about recently ported apps:

- gcc-3.3 et g++-3.3. Mintlib includes must be corrected, there is an
archive for this purpose on my site (mintbind-gcc3-*)
- physfs: library to transparently access file archives (zip, pak, etc...)
mainly for games and demos.
- sdl: version 1.2.6, with bug fixes (audio and video drivers).
- doom: version 0.30pre1, video mode selection, screen zoom.
- scummvm: version 0.5.3 (cvs 20030903), a game engine for some
point-n-click games (UNTESTED, I don't have any game to test).

More rotund than around! ;-)

I found the (ahem) windoze source code. The file with the *.000 extender is a plain old text file. It lists all the parts, sizes and checksums. Nothing special occurs when rejoining so a simple concatention of *.001 -> *.nnn will reconstruct the file. The windoze version was/is supposed to be compatible with the ST version and that one was compatible with the GEM version (which had a cli version in it) so the afore mentioned ought to work for them all.

It won't work on spanning zips. They're different. So are hedgehogs in case anyone was confused about them. It's definately not recommended to unzip a hedgehog. They don't like it.

I agree 100%! There are far less offensive ways to get your point
across. I guess some people just don't feel they are impacting the
group enough if they don't swear. They couldn't be more wrong, IMO.

Thomas,

Thanks for the reply. Unfortunately, I haven't found an Amiga
yet to be able to do this. I'm trying to get the contents of some
disks from Atari that contain Lynx development software and
code.

Just have to keep combing the thrift shops until I find one.

I think 99,9 % of the Atarians are pleased when new/updates, expecially commercials ones, see the light. We must be all glad there are still some software houses who supports our platform.

> O.K., it might not be perfect, and if you've spent money on it you
> expect it to work well.

Sure one expect the soft will work ok but the perfect piece of software doesn't exist and will never exist.
I can perfectly understand people gets upset when it turns out the soft contains lots of bugs but that doesn't give someone the right to break it down completely especialy when one doesn't provide evidence.

> But how many PC users are constantly
> disappointed by the bugs in their software, and then, after upgrading it

That's why I don't use Windows anymore on pc. Whatever you do don't upgrade to XP. It looks nice and it works good but one isn't the master of the pc anymore. To give you one example read this:
<URL:http://www.theregister.co.uk/content/4/25956.html>
I should say install Linux and you'll be happy :-)

> It's a far from perfect world, but I find most of the Atari platform

Isn't it strange only two people (always the same duo) have serious complaints about Papyrus? Dozens of others (including me) are happy with Papyrus. When Papyrus X see the light I'll buy it.

>
> I've ignored countless posts on this list in recent months and resisted

Tempus-Word NG will be coming soon in an English version.
One of the functions, planned for the near future, is HTML
export for a complete document, with i.e. navigation through
chapters.

As soon as this version is available, the English pages at
tempus-word.de will be extended; cross-grading from other
programs will be possible, too.

The quickest way to boot an ST is with a blank formatted diskette in the
drive but it seems you have other problems.

I had a fellow Atarian program some PICs for me, but never made an
Eiffel for a couple of reasons. You didn't mention cost, but I'd be
interested in buying a ready made Eiffel as a model for my work.
(I've soldered before, but only to make repairs -- I've never actually
MADE anything.)

There are a few programs that get around the limitation of (actually 6) accessories.

One is a commercial program from Codehead Software called MultiDesk. There's a free one called Chameleon. There are others, both commercial and free, that still have the limit but at boot time allow you to choose which 6 you'd like (basically rename others to .acx).

All worked very well.

- Ross.

That's the good news, I have got a spare STe, it's a bog standard 1040, hardly used and working fine. I need to transfer the necessary part from that one to the one that's having the problem but I need to identify the part in the case so I can remove it. Any help with that would be appreciated.

Yep,

Put me down for one too mate.

I think there may be a bit more general interest with up and coming
recasings, due to CT60 installation etc. So this move could be very
timely :)

You need some sort of DOS to be able to format/partition it. Create a
bootdisk first, and boot on floppy. Then perform the necessary
formatting and partitioning of the harddrive.

This is an Atari area, but I will say that inorder to use the
fdisk command, you must have that program on the "A" floppy disk
as well as all other needed commands. When you type "fdisk" the
computer is looking for it on the "A" disk. I will also say, it is
much easier to do this on an Atari computer.... <g>

Hi,

OK, the support has been amazing! To let everyone know, I will be sending off an order to get a small batch made, then will need to order the components and assemble them.

I'll let people know how it progresses, I didn't realise that so many people wanted one.

Thanks for the support, Lyndon

On my Hades, running freeMiNT 1.15.12/N_AES 2.0.0 I don't have to switch
off the caches. Papyrus starts up just fine. Even with Ozk's mmutools,
which I use since quite some time, Papyrus works great.
I must say I don't use the latest version. I've v8.20a.

Sure it does what its told to do and even more. Anyway, it's no matter of misinformation, it's fact. Read the new EULA. If you want to use an insecure system that's your decision, but I've made my decision. No more XP for me. I don't want to give Bill Gates and others the opportunity to access my pc without my permission.
On pc Linux is my choice. On Atari freeMiNT is my choice.

quote of the day: Windows, the only virus I know with a manual.

TTFN,

Lyndon,
Put me down for one as well!!!! I know 2 other
people that may also be interested in one of these as
well!!! I will let you know via e-mail how many to
reserve for us as well.

Thanks,
Carey

> order the components and assemble them.

I'll be more than happy to assist in the assembly if you need any help and
I'm only a short trot by post away being in Kent.

I know someone who's interested in this project but who is temporarily
unavailable so stroke an interest for Mr. Mark Branson.

I recently saw that Steve at Wizztronics is liquidating his remaining
stock of Falcon Racks. The price is still more than a PC case, and my
desk is set up for a pc case, but I've decided to get one. There will
be a lot fewer problems using something with good space for everything
I need, and designed for the falcon. I think I can f8nd a way to make
my desk work!

Yes!, you need to set your BIOS to boot from CD, once you do this the
Windows XP pre-installer will partition and format as you please and then
install WIN-XP for you. No extra formatter of partition software required

Hi Patrice,
Is Doom 0.30pre1 for the Falcon? I'm running single TOS 4.04 and 50mhz
(PhantomSE) and the game runs extremely slow!
Also, is sdl needed for this version of Doom and is it for the same
system?

The Nova driver seems to have problems on my Hades060, which one can get
around by turning the caches on after the driver loads. I know ozk has
fixed this himself on his machine, with the help of a dissassembly.
However, since he uses the et6000 version and myself the et4000 version,
his fix won't help everyone. If you need help, ozk would be very willing to
help with this, just visit http://assemsoft.atari.org/

Sounds like this is SPLITTER by S. Coates and M.J. Matts, which
needs both SPLITTER.TTP and SPLITTER.PRG if you want to use the
GEM version. They are only 70 kB in all, so I could email them to
you if you like.

Glad the programs found a good home.
As for the Nova driver, I'm not sure what the problems are on the ct60
with it, but on the Hades060 it's due to self modifying code. If such code
ends up in the cache at the wrong moment then it causes problems. It might
be that you need an assembler expert versus a VDI expert. Either way it
would be nice to see it fixed.

Some people in this group just don't grasp reverse engineering, what is
theft and what isn't. I wouldn't worry about it. lol

I don't know if you will get very far with that since he gets an awful lot of emails. I personally have two copies of the Version 3.42 catalog, the 95-96 catalog and the "Barn" catalog. I should since I used to own half of that company. I don't have any problems with people scanning and posting these but since Dave Troy was the one who put them together you should get his OK.

Actually, strange though it may sound, the source code would be handy so yes
please. The sources to my windows version are dire - I'd only just got
Builder at the time and knew nothing about Delphi (VCL), C++, or windoze!

My email is as shown minus the -DEL- part.

6266. FA*ST Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2003-09-07 17:39:13 UTC
From: jon
Message-ID: <P2K6b.18744$n94.4631@fed1read04>
Source record: 23797

I just acquired an ICD FA*ST hard drive from ebay. It did not have a drive in it, but, the power supply and controller are there. I installed an IBM 2 gig scsi drive in it and it seemed to work fine. Now I get random drive restarts and other drive not found errors. Is there a limit to the drive size I can use?

Since I don't have the docs to this unit, I am stuck. Is there anyone out there who might have the docs that came with this unit? ICD's web page is of no help. A search of the web couldn't find them either. I'm assuming that I don't have something set right on the drive itself.

Thanks

6267. [ANN] Meg 1.1

Bonsoir :)

Small update of Meg (mailboxes checker and anti-spam filter).
Download at http://rajah.atari.org or direclty on
http://membres.lycos.fr/nef/files/ -> meg11_uk.zip (220 Kb)

new features:
- bugfix of 'To' and 'Reply-To' field confusion
- bugfix of several lines field detection (both tab and space)
+ new parameter : number of lines of mail body to retrieve for analyse
+ accessory mode (with no guarantee on stability, prefer APP mode in
multitasking environment)
+ new filter : mail size
+ new notification type : in AtarICQ window
+ new notification type : system bell

Thanks to Jean-Marc, Pascal & John.

Bye

It's a little hardware that allows to connect both a PS/2 mouse
and keyboard to an Atari, and, with the latest release, it is
possible to connect joysticks and to control the internal
temperature too.
It was made by someone whose initials are F. L., hence the name.
More about it at http://eiffel.atari.org

The Falcon Rack is the way I decided to go too. The case is quite
strong, and could handle a 17" monitor on top. You have to make a
fair amount of custom cabling to extend the left hand and front ports
(the rear ports are flush against the case's edge) however, and at
least on mine, the mounting posts for the motherboard do not line up
perfectly (not too significant a problem).

Maybe it is not a setting. I got four identical drives on E-bay, made by Honeywell. I am now on the fourth one, and it seems to be working OK.

The first three apparently started losing speed randomly, and the symptom was files not found. Finally each of them died by stopping, restarting, and finally not restarting.

But, every disk checking program I had showed nothing wrong with the drives, until they refused to do anything.

I would suggest trying another SCSI drive.

Well, for the Cart and midi ports, I've bought stuff from steve at
wizztronics designed for the Falcon rack, so I should be good there.
For the mouse and joystick ports, I'm waiting for an Eiffel. If there
is any problem with that, steve makes something that should work.

Hi Pierre,
A surprising thing happened while downloading with CAB. The double bell rang! I forgot I had Meg installed as an accessory and it was checking the mail at the same time with no seemingly ill effects on the download! So I went to Newsie from CAB, got the mail and from there I went to Everest to reply and I noticed a slowdown of screen loading. By time I edited a letter the system slowed down to a dead stop!
I reralize Meg is for a multi-tasking system and you didn't advise using it as an ACC but I thought I'd let you know anyway.

John

> (PhantomSE) and the game runs extremely slow!

Try another videomode (using the '-videomode' parameter).

Note: Doom will still be slow, but not that slow. Patrice's Doom port
does not use the DSP, 68030@25Mhz in your case I guess.

> Also, is sdl needed for this version of Doom and is it for the same
> system?

Nope.

Bonjour :)

> I went to Newsie from CAB, got the mail and from there I went to Everest
> to reply and I noticed a slowdown of screen loading.

The operation you describe is suited and convenient under multitasking mode.
CAB, Newsie, EvereST and Meg can run together withtout problems under MagiC.

Under SingleTOS, all of theses successives launches and program ends far
away form the desktop can damage the system : memory allocations above the
last program are deleted without warning by the TOS, or vice-versa, some
memory allocations are not made free. (you need also a big amount of RAM).

Still, with your sum of programs in memory, I'm not sure that Meg provokes
this "slowdown of screen loading", since the caller program (ie CAB) is
freezed under SingleTOS to run its child (ie Newsie), while STinG or Meg can
run coz the first is TSR (or something like that) and the second is running
as ACC.

Remember that the launch (pexec) of another child program is permited, but
it's not convenient : multitasking environment were created for that.

Bye

6284. New 15-16KHz vert. refresh monitors available!

Newsgroup: comp.sys.atari.st
Date: 2003-09-08 15:33:02 UTC
From: julianwolfe@earthlink.net
Message-ID: <de454671.0309080733.2075406@posting.google.com>
Source record: 23816

I thought I'd point this out - this company sells combo TV/Monitor systems for about 225 USD. They support the 15-16KHz vertical refresh range, and also the 30-60 KHz.

Might be of interest for those of you looking to replace your old ST monitor in North America.

here's the link:

http://www.miraclebusiness.com

They also sell monochrome VGA diplays ideal for replacing the SM124/125 with.

Peace, Atarians!

Julian

Dunno why the OP's asking about wheel bearings either. The *only* useful thing you can do with a honda 50 step-through, is pull excellent wheelies. Preferably whilst someone else is on it!

Hint: wait 'til the plonker riding it winds the throttle back, tap on his shoulder, then stamp it into gear. Often they flick right over. Easy 20 points that is (extra bonus 50 for nads).

Hi!!!

They are nice! Just make DARN certain that the monitors can handle the
freaky RGB levels of the ST/Falcon line; 1.8V p-p @ 1.2VDC bias.

Source record: 23822

Just to say that stories about FULL 060 that are marked EC should not exist
!!

In fact I can a tell you that all 060 I shipped on CT60 are EC marked !!!

OK ?
WHY ??

Motorola produced some very important amount of FULL 060 that they marked EC
because at this moment some of their big customers were requesting EC low
cost 060 and motorola had no time to produce them, so they decide the stamp
some 060 as EC but they were FULL models !!

The CT60 BIOS analyse the registers of the 060, and all EC that I plugged
(and you use if you have a CT60 + 060 FULL) are well identified as 060 with
PMMU & FPU !! And the FPU works fine !!

Ok, on CT60 I have no problems with customers afraid by the EC letters
because I stick a heatsink on the 060....;-))

I hope the discussion about 'EC instead of FULL' shipping will end now !

I never had problems with Vernal Elm !
I had some bad 060 (four pieces) and they accepted to replace them...

My only problem now is that I wait for my order since a long time.... but
that's not the first time there is a delay and I not ordered only one
piece...so they may need more time for my order...

I did some work on my CT60 in a Falcon Rack yesterday and found that
it was a pretty tight fit due to the digital joystick extenders. It
also was too long a stretch for my power supply -- anyone know where
one can get a power supply extension cable?

6294. help needed for stuck floppy light

Newsgroup: comp.sys.atari.st
Date: 2003-09-09 01:22:09 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0309081722.55ad2847@posting.google.com>
Source record: 23826

Hello everyone,

Since I hadn't played with my spare Falcon for a month or so I thought
I'd test it before I installed my CT60 into it. It worked fine, save
that the floppy light refused to go off (at least most of the time)
and upon the first attempt to access any floppy the computer gave a
"this disk cannot be read" error. Any ideas what might be ailing the
floppy?

6295. Help needed with CT60 instability

Newsgroup: comp.sys.atari.st
Date: 2003-09-09 01:28:40 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0309081728.15ef411a@posting.google.com>
Source record: 23827

Hello again,

My CT60 installed easily enough last night, although I had to disconnect the hard drives temporarily until my damaged copy of HDDriver gets replaced. (Wow! 256Mb of RAM and 1.44Mb of disk space!) However, it seems to be fairly easy to get a screen full of numbers and a lock up (or occassionally just a lock up). I haven't had time to hunt down the problem, but I worry that the cause might be my brand new 133Mhz SODIMM, which is only returnable for two weeks. Thus, could CT60 owners give me some idea of what troubles they had with RAM? It would help me decide whether to race back to the store for another stick.

Ok Rajah (or Pierre :),
Thanks for the explanation (although a bit over my head, I get the
basics). One note, I frequently run CAB and use external to go to Newsie
and from their reply with Everest (or QED) but never saw a slow-down in the
system! I assume that Meg (as an ACC. set to check mail every 2 minutes)
was just the last straw so I wasn't implying that it was Meg's fault!

Appreciate your work,
John

Hi Peter,
I tried it at 16 bit as a guess since the screen at loading goes by too
fast to see what's up! All that did was shrink the game screen in half
vertically and still ran extremely slow (even with the sound off)!
I use version 0.27. 0.28 crashes and in later versions the fire button on
the joy stick moves the guy forward instead of firing (critical for the
exterminator :)

What kind of ATX-power are you using? With older ATX-power I've had
no problems whatsoever, but with 350 W P4 compatible ATX-power the
situation was different...

CT60 worked only about half a minute, sometimes little bit longer,
then there were error messages or the system just halted...

Do try with older ATX-power first, before returning the 133MHz
SODIMM, as after changing the ATX-power, every tested memory module
has worked well so far (64 MB, 128 MB and 256 MB).

Regards,
Kimmo

Many people actually.. LaTeX that is. It's so much more reliable than glossy wysiwyg programs like Word, and it's usable with codemanagers and the likes. So especially for large scientific works, LaTeX is often used. Another great advantage is that large fully layed-out documents remain pretty small in filesise, since they're not stuffed with binary noninformation. And of course, no viruses. :)

> CD(whoa-an Atari app on CD-the only?).

Hihi, what planet have YOU been on in the last ten years?!?! There have been gazillions of CDs with Atari stuff.. and not just the regular PD stuff (wonderful collections, "Whiteline" rules), but also for example MiNT distributions, several(!) different complete Linux distributions for Atari.. And all new Calamus versions are sold on CD only. The only thing that never really got off the ground is CD-games (like the PC adventures that use the CD all the time for enhancing the game with prerendered music and animations).

But really, the computer world is larger than what you see through your Windows(TM). ;)

Maurits.

Have you asked Steve at Wizztronics about it? I spoke to him
yesterday, and ordered the Falcon Rack, brackets for ide drive and
cdrw, and power switch. I told him about the CT60, and mentioned that
you were working on installing yours. He was interested in talking to
you about the project so that he can be prepared for any issues. Why
don't you give him a call, and let me know what you find out too!

6306. Doom configuration (was Re: [WWW] Some new software on my site)

> fast to see what's up! All that did was shrink the game screen in half
> vertically and still ran extremely slow (even with the sound off)!

Try the new 0.30pre2, it can lists video modes ('-listmodes').

> 0.28 crashes and in later versions the fire button on the
> joy stick moves the guy forward instead of firing (critical for the
> exterminator :)

Don't forget than on the ikbd mouse/joysticks ports, fire buttons are
common to both ports (at a hardware level: no change possible!):
- port 0 fire 0 (left mouse button) = port 1 fire 1 (second. fire button)
- port 0 fire 1 (right mouse button) = port 1 fire 0 (primary fire button)
As Doom checks first for mouse, pressing joystick fire means right mouse
button = move forward.

If you want to change the behaviour, edit the doom.cfg file, and change:
mouseb_fire 0 -> change to 2 (mouse fire=right button=joy fire)
mouseb_strafe 1 -> change to 1
mouseb_forward 2 -> change to 0 (mouse move=left button=no joy fire)

And please, could someone with a joypad can tell me if it works ?

Hello Martin,

Yes, under freeMint, Papyrus runs fine and also under Geneva. I am
running mine mostly under Magic using Ozk's mmu program. I have
found that under Magic without the ram beening split and using the
Hades acc program, it runs better. But it does not take too much
effort to get Papyrus to run, so I just fiddle with the cache.

You should definately post this question at the Dead Hackers support
site on the bullitin board

http://bbs.dhs.nu/ct60/

Have you updated the ABE & SDR chips? The software and schematics for
the cable required are at Rudolphe's site. Andreas Pettersson is
making Atari versions of the cable nessesary for this. The price will
be EUR25 plus shipping. It seems to me that it might be related, but
I'm not sure.

The seats are. The skill of it is to get them slightly off balance. That way the steering goes full lock as the wheel comes up. If the victim's lucky they'll get a side swipe (aka "the flick") from the left handler bar and if they're not they'll get the whole steering column (aka "the hammer"). Even a novice competitor might get a late result as the machine lands upside down: from the front wheel (aka "the (snapping) turtle").

ATX power problem were done by two things :

1- It is needed to add a polarized capacitor on C7 on the mb near the RESET switch..
This will extand the reset delay during power on (that is surely different with several ATX PSU !) and let more time for voltages to stabilize....
this capacitor may be at least 22uF up to (what you want) and at least 10V (or more too).

2- There is a strange bug inside SDR that may manifestate only with some very rare 060 (just had one this time !) and gives ERROR # 24 (SUPRIUS INT).
In this case, contact me for SDR 5E (le last one not yet online).

About DIMM (not SODIMM !! SODIMM are for notebooks !!), see my table on my web page !
Just to add that the BYTE # 18 must be 06 (CAS LATENCY OF 2 or 3) because CT60 SDR controller does not accepts CL=3 and initialize your DIMM with CL=2, so CL=2 must be supported by the DIMM ! If not the new 0.99d boot (take it on Didier's web pages or see link on my web site) testes this bytes...and stops the boot if a feature of the DIMM is not supported...
